**New! Artificial Intelligence!**

**5th-Generation Language!**

**\$10.00 Scratch 'n Win Rebate!**

## Turbo Prolog™

"If you're at all interested in artificial intelligence, databases, expert systems, or new ways of thinking about programming, by all means plunk down your \$100 and buy a copy of Turbo Prolog."  
Bruce Webster, BYTE

"Borland International, Inc. is gunning onto the fast track in the artificial intelligence and engineering-language-software race, riding aboard a new \$99 Turbo Prolog," says Tom Schwartz in *Electronic Engineering Times*. And so we are. Our new Turbo Prolog has drawn rave reviews—which we think are

well deserved—because Turbo Prolog brings 5th-generation language and supercomputer power to your IBM PC and compatibles. Turbo Prolog is a high-speed compiler for the artificial intelligence language, Prolog, which is probably one of the most powerful programming languages ever conceived. We made a worldwide impact with Turbo Pascal and you can expect the same results and revolution from Turbo Prolog, the natural language of artificial intelligence. Darryl Rubin, writing in *AI Expert* said, "Turbo Prolog offers generally the fastest and most approachable implementation of Prolog." Suggested retail, \$99.95. Use a \$10.00 Scratch 'n Win Rebate and that goes down to only \$89.95! Minimum memory: 384K.

### Technical Specifications:

**TURBO PASCAL 3.0** Minimum memory: 128K; includes 8087 and BCD features for 16-bit MS-DOS and CP/M-86 systems. CP/M-80 version minimum memory: 48K. 8087 and BCD features not available. **TURBO DATABASE TOOLBOX** Minimum memory: 128K. CP/M-80 minimum memory: 48K. Requires Turbo Pascal 2.0 or later. **TURBO GRAPHIX TOOLBOX** Minimum memory: 192K. Requires PC/MS-DOS 2.0 or later, Turbo Pascal 3.0, and IBM CGA, Hercules Monochrome Card or equivalent. **TURBO TUTOR 2.0** Minimum memory: 192K. CP/M-80 version minimum memory: 48K. Requires PC/MS-DOS 2.0 or later and Turbo Pascal 3.0. **TURBO EDITOR TOOLBOX** Minimum memory: 192K. Requires PC/MS-DOS 2.0 or later and Turbo Pascal 3.0. **TURBO GAMEWORKS** Minimum memory: 192K. Requires PC/MS-DOS 2.0 or later and Turbo Pascal 3.0. **TURBO PROLOG** Minimum memory: 384K. **REFLEX: THE ANALYST** Minimum memory: 384K. Requires IBM CGA, Hercules Monochrome Card or equivalent. Works with Intel's AboveBoard-PC and -AT, AST's RAMpage! and RAMpage! AT, Quadram's Liberty-PC and -AT, Tecmar's 640 Plus, IBM's EGA and 3270/PC, AT&T's 6300 and many others. **REFLEX WORKSHOP** Minimum memory: 384K. Requires Reflex: The Analyst. **TURBO LIGHTNING** Minimum memory: 256K. Two disk drives required. Hard disk recommended. **LIGHTNING WORD WIZARD** Minimum memory: 256K. Requires Turbo Lightning Turbo Pascal 3.0 required to edit source code. **SIDEKICK** Minimum memory: 128K. **TRAVELING SIDEKICK** Minimum memory: 256K. **SUPERKEY** Minimum memory: 128K. \*For IBM PC, AT, XT, PCjr and true compatibles only, running PC/MS-DOS 2.0 or later.

**Build Your Own Word Processor!**

**\$10.00 Scratch 'n Win Rebate!**

## Turbo Editor Toolbox™

Recently released, we called our new Turbo Editor Toolbox a "construction set to write your own word processor." Peter Feldmann of *PC Magazine* covered it pretty well with, "A 'write your own word processor' program for intermediate level programmers, with lots of help in the form of prewritten

procedures covering everything from word wrap to pull-down windows." Source code is included, and we also include MicroStar, a full-blown text editor with pull-down menus and windowing. It interfaces directly with Turbo Lightning to let you spell-check your MicroStar files. Jerry Pournelle of *BYTE* magazine said, "The new Turbo Editor Toolbox is the Turbo Pascal source code to just about anything you ever wanted a PC-compatible text editor to do." Suggested retail: \$69.95. Use a \$10.00 Scratch 'n Win Rebate and you'll get all this for only \$59.95! Minimum memory: 192K.

MicroStar file directory accessed by pull-down menu

### Borland's Business Productivity Programs:

- Reflex: The Analyst** Analytical database manager. Provides complete, new look at data normally hidden by programs like 1-2-3\* and dBASE.\* Best report generator for, and complement to, 1-2-3.
- Reflex Workshop** Important new addition to Reflex: The Analyst. Gives you 22 different templates to run your business right.
- SideKick** Complete RAM-resident desktop management includes notepad, dialer, calculator and more.
- Traveling SideKick** Electronic version of business/personal diaries, daytime organizers; works with your SideKick files; important professional tool.
- SuperKey** Keyboard enhancer. Simple macros turn 1000 keystrokes into 1. Also encrypts your files to keep confidential files confidential.

### Borland's Electronic Reference Programs:

- Turbo Lightning** Works with all your programs and checks your spelling while you type! Includes 80,000-word Random House\* Concise Word List and 50,000-word Random House Thesaurus. Forerunner of Turbo Lightning Library.\*
- Lightning Word Wizard** Includes ingenious crossword solver and six other word challenges. If you're into programming, Lightning Word Wizard is also a development toolbox and the technical reference manual for Turbo Lightning.

# Turbo Pascal Programming

Learn Secrets, Strategies,  
Game Theory!

**\$10.00 Scratch 'n Win Rebate!**

## Turbo GameWorks®

Also recently released, Turbo GameWorks is what you think it is: "Games" and "Works." Games you can play right away (like Chess, Bridge and Go-Moku), plus the Works—which is how computer games work. All the secrets and strategies of game theory are there for you to learn. You can play the games "as is" or modify

them any which way you want. Source code is included to let you do that, and whether you want to write your own games or simply play the off-the-shelf games, Turbo GameWorks will give hours of diversion, education, and intrigue. George Koltanowski, Dean of American Chess, and former President, United States Chess Federation, reacted to Turbo GameWorks like this: "With Turbo GameWorks, you're on your way to becoming a master chess player." And Kit Woolsey, writer, author, and twice Champion of the Blue Ribbon Pairs, wrote, "Now play the world's most popular card game—Bridge... even program your own bidding and scoring conventions." Suggested retail: \$69.95. Use a \$10.00 Scratch 'n Win Rebate and you're talking an incredible \$59.95! Minimum memory: 192K.

Turbo GameWorks' Chessboard

Create Your Own  
High-Res Graphics!

**\$10.00 Scratch 'n Win Rebate!**

## Turbo Graphix Toolbox®

It includes a library of graphics routines for Turbo Pascal programs. Lets even beginning programmers create high-resolution graphics with an IBM, Hercules,™ or compatible graphics adapter. Our Turbo Graphix Toolbox includes all the tools you'll ever need for complex business graphics, easy windowing, and storing screen images to memory. It comes complete with source code, ready to compile. Suggested retail: \$69.95, but with a \$10.00 Scratch 'n Win Rebate, only \$59.95! Minimum memory: 192K.

The Ultimate  
Learning Experience!

**\$10.00 Scratch 'n Win Rebate!**

## Turbo Tutor® 2.0

The new Turbo Tutor can take you from "What's a computer?" through complex data structures, assembly languages, trees, tips on writing long programs in Turbo Pascal, and a high level of expertise. Source code for everything is included. New split screens allow you to put source text in the bottom half

of the screen and run the examples in the top half. There are quizzes that ask you, show you, tell you, teach you. You get a 400-page manual—which is not as daunting as it sounds, because unlike many software manuals, it was not written by orangutans. Suggested retail: \$39.95. Use a \$10.00 Scratch 'n Win Rebate and you're down to an unheard of \$29.95! Minimum memory: 192K.

## How to use Scratch 'n Win Rebates

It's really simple. You purchase the product between 9/5/86 and 3/31/87, and return the license agreement along with dated proof of purchase and your rebate card. We'll mail you a check for \$10.00 on single product purchases or a check for \$15.00 when you buy an advertised "bundle"—which means our Turbo Pascal Jumbo Pack, or Turbo Lightning and Lightning Word Wizard, or Reflex: The Analyst and Reflex Workshop, or SideKick and Traveling SideKick. (Restrictions do apply. See Official Rules on back of Instant Winner card).

Recognition for Borland International has come from business, trade, and media, and includes both product awards and awards for technical excellence and marketing.

**America's Cup. Coming Soon!**

# Borland's award-winning software is the best Holiday present you can give yourself or anyone else

**A**ny one of these Holiday presents could save your marriage, career, reputation and quite a few bucks.

When you give or get any one of these Holiday presents, every day's a Holiday, because you're giving or getting long-lasting software that's a lot more welcome to the Woman in your Life than vacuum cleaners, egg-beaters and ugly earrings. And the Man in your Life would rather have Turbo Prolog,<sup>®</sup> Reflex,<sup>®</sup> Reflex Workshop,<sup>®</sup> Turbo Pascal,<sup>®</sup> Turbo Lightning<sup>®</sup> or SideKick<sup>®</sup> than socks, ties and wrong-size shirts.

**Turbo Prolog takes you by the hand into the brave new world of Artificial Intelligence**

Artificial Intelligence is no substitute for the human brain (well, most human brains; you make your own list), but it is a fascinating new field, and we're leading it with our 5th-Generation Turbo Prolog. In fact, people are telling us that Turbo Prolog is "The most exciting product they've seen this year." So see it for yourself. Give it. Get it. You deserve it.

**Turbo Pascal wins PC World's 1986 World Class PC Award for 'Programming Language'!**

**Give someone our Turbo Pascal "Jumbo Pack," but keep some of the precious pieces for yourself**

There's so much in there—Turbo Pascal, Turbo Tutor,<sup>®</sup> Turbo Database,<sup>®</sup> Turbo Graphix,<sup>®</sup> Turbo GameWorks,<sup>®</sup> Turbo Editor<sup>®</sup>—you can probably give someone else one or two of them. (Just keep the ones you don't have already and make the rest thoughtful, really inexpensive presents for someone's Turbo Pascal library.)

**Give them one, maybe two kinds of Holiday Reflex action!**

Adam B. Green, InfoWorld's highly respected columnist, says "Everyone agrees Reflex is the best-looking database they've ever seen." Peter Norton of PC WEEK says, "The next generation of software has officially arrived." And now, with our brand-new Reflex Workshop, which includes 22 instant ways to run your business well, you can give someone both programs and just about guarantee them a Happy well-run New Year!

**Turbo Lightning wins the 1986 World Class PC Award for "Most Promising Newcomer"!**

**Solve your gift-giving and spelling problems now with Turbo Lightning**

While you use SideKick, Reflex, Lotus 1-2-3<sup>®</sup> and most popular programs, Turbo Lightning proofreads *as you write!* If you misspell a word, Turbo Lightning will beep at you instantly, and suggest a correction for the word you just misspelled. Press one key, and the misspelled word is immediately replaced by the correct word. And if you're ever stuck for a word, Turbo Lightning's thesaurus is there with instant alternatives. Perfect gift for everyone who reads and writes!

**Attention SideKick users!  
Your SideKick now has a sidekick!**

**If you're going anywhere for the Holidays, you'll need a Traveling SideKick!**

It's the electronic organizer for this electronic age—a professional binder, a software program and a report generator—a modern business tool that prints your ever-changing appointments in daily/weekly/monthly/yearly form. Your appointments, phone list, address list, meeting schedule, travel itinerary—even your mailing list—can be kept up-to-the-minute correct *and with you!* (SideKick Owners: All your files translate instantly to Traveling SideKick.) Traveling SideKick is electronic, so it's good for this year, next year and all the next years after that—it's not a dusty old diary that dies Dec. 31!

## Borland's Instant Winner Game

Scratch this card now and you could *instantly* win 2 free round-trip airline tickets to Australia for the America's Cup Race!

**\$10,000**

First Prize (\$10,000 value!) includes accommodations for two in Perth, Australia during the final America's Cup races, which start January 31, 1987. See America win it back after our *only* loss in 134 years! There's more than one *instant winner* in Borland's

Instant Winner Game, because you could win one of two new \$6,895 4-WD Suzuki Samurai convertibles,

**\$6,895**

printer, or a \$4,499

or a \$4,995 AST TurboLaser™

\$2,399 Toshiba T1100™

Toshiba T3100,™ or a

AST SixPakPremium™, or a \$69.95 Traveling SideKick®, or

any one of hundreds of other Borland products—and at

**\$69.95**

the very least a Borland Rebate Coupon, good for \$10 off any single product or \$15 off any bundled product offer!

**\$4,499**

See Official Rules on the back of this card for details.

Don't delay! There will be a second-chance drawing for the trip if not claimed by 12/30/86. There's also a second-chance drawing for the two Suzukis if not claimed by 2/28/87. All rebate coupons are good for products purchased 9/5/86-3/31/87. Product prices above are suggested list prices.

Rub the silver box to reveal whether you win a prize or get a rebate coupon. Then fill in the second-chance entry blank to the right.

**SCRATCH  
'N WIN!**

### Second-Chance Sweepstakes Entry!

We're running two Second-Chance Sweepstakes drawings to award the trip and cars. They *will be won* by someone—it *could be you!* Fill in the entry coupon and mail it now. Winners will be notified immediately, because the final America's Cup races start in Australia on January 31, 1987, and you'll have to pack in a hurry.

(You will need a valid passport and the ability to comprehend Australian versions of the English language.)

# **OFFICIAL RULES - BORLAND INSTANT WINNER GAME**

**1. NO PURCHASE NECESSARY:** To participate, you may obtain a game card inserted into the October, November, December, or January issue of the following magazines: PC World; Byte; PC Tech Journal; PC Magazine. You may also obtain a game card by mailing a self-addressed, stamped envelope to: Borland International Game Card, P.O. Box 870, Wilton, CT 06897. (Washington State residents send self-addressed envelope.) Limit one game card per stamped request. All requests must be received by January 15, 1987.

**2. TO PLAY:** Remove the rub-off area on the game card to reveal what prize or rebate offer you have obtained.

**3. PRIZES/REBATES:** Beneath the rub-off area one of the following prizes may be revealed: Trip for Two to America's Cup Races or \$10,000; 1986 Suzuki 4W Samurai Convertible or \$6,895; AST Turbo Laser; Toshiba 1100 Portable Computer; Toshiba 3100 Portable Computer; AST Sixpak premium; AST Advantage premium; AST 3G Pak; AST Rampage; AST Rampage AT; Free Borland Product, or you may obtain the following rebate offer: \$10 rebate offer on any individual product or \$15 rebate offer on any single advertised Borland bundle (See rule #11 for prize details).

**4. PRIZE CLAIMS:** If you obtain one of the prizes stated in Rule #3, sign your full legal signature on the game card and send via certified mail (copy should be made for your records) along with your name and address to: Borland International Prize Claim, 186 Danbury Road, Wilton, CT 06897. All prize claims must be received or postmarked by February 15, 1987. (See Rule #12 for Trip for Two to America's Cup exception.)

**5. REBATE CLAIMS:** Rebates are good for products purchased from September 5, 1986 through March 31, 1987. The \$10 rebate is good for any individual Borland product and the \$15 rebate is good for any advertised Borland software bundle. To receive your rebate you must return your completed license agreement from the manual, this game card and dated proof of purchase to: Borland International, Game Card Rebate, 4585 Scotts Valley Drive, Scotts Valley, CA 95066. Upon receipt of the license agreement, game card and proof of purchase, Borland will send your check. Rebate is not valid with any other rebate or promotion offered directly from Borland.

**6. VERIFICATION:** All game materials are subject to verification. Game materials are void and will be rejected if not obtained through authorized, legitimate channels, and may be rejected if any part is reproduced, counterfeited, torn or altered in any way, or if materials contain printing, typographical, or mechanical errors. Decisions of the Redemption Center are final. Game pieces from any game other than the Borland Instant Winner Game may not be used in this game.

**7. CONDITIONS OF PARTICIPATION:** Material submitted becomes the property of Borland International. The submission of game pieces is the sole responsibility of the individual seeking verification, who is solely responsible for lost, late, or misdirected mail. All taxes, registration and inspection fees are the sole responsibility of the verified winner. Winners may be required to execute an affidavit of eligibility and name and likeness publicity release. By participating in the game you accept and agree to be bound by these rules and the decision of the Official Redemption Center which will be final.

**8. ELIGIBILITY:** Participation is open solely to residents of the United States 18 years of age and over, except employees and agents of Borland International, service agencies, and individuals engaged in the development, production, or distribution of game materials. The Merritt Group, Inc. and their immediate family or members of their households. Void in Vermont and where prohibited by law.

**9. GAME SCHEDULE AND AWARD OF PRIZES:** The Borland Instant Winner Game will commence on or about September 5, 1986 and end on January 30, 1987. It will officially end, however, when all game pieces are distributed. Verified game prizes will be awarded within thirty (30) days from the date of their receipt for verification at the Official Redemption Center. A major prize winners' list can be obtained by sending a stamped, self-addressed envelope to: Borland Instant Winner Game Winners' List, P.O. Box 7089, Wilton, CT 06897.

**10. ODDS CHART:** The odds of winning prizes are based upon obtaining the one rare game piece among the applicable number of game pieces.

PRIZE	Qty.	Total Value	Odds of Winning
Trip for Two to America's Cup or \$10,000	1	\$ 10,000.00	1 in 6,458,000
Suzuki 4W Samurai Convertible JA or \$6,895	2	\$ 13,790.00	1 in 3,229,000
AST Turbo Laser	1	\$ 4,995.00	1 in 6,458,000
Toshiba Portable Computer	2	\$ 6,898.00	1 in 3,229,000
AST Memory Boards	25	\$ 15,025.00	1 in 258,320
Borland Products	1,000	\$149,000.00	1 in 6,458
<b>OVERALL TOTAL</b>	<b>1,031</b>	<b>\$199,708.00</b>	<b>1 in 6,264</b>

All remaining game cards will contain a \$10 rebate good on any individual Borland product or a \$15 rebate good toward any advertised Borland software bundle.

**11. PRIZE DETAILS:** Trip for two to America's Cup Races (or \$10,000) will include coach seating round trip airfare on regularly scheduled commercial airline from San Francisco, California to Perth, Australia and up to two weeks hotel accommodations in Perth, Australia plus \$4,500 spending cash. Winners will be responsible for obtaining visa, passport, and all other travel documents. Trip does not include meals, taxes, excess baggage charges and other hotel charges. Minor must be accompanied by parent or legal guardian.

Suzuki 4W Samurai Convertible JA Standard Equipment Package (or \$6,895), verified winner will be responsible for all registration, insurance, and licensing fees. AST Turbo Laser; Toshiba Portable Computer Model # T1100; Toshiba Portable Computer Model # T3100; AST Memory Boards and Free Borland Products are non-substitutional except by sponsor due to product availability and all warranties and guarantees are subject to manufacturers terms. All prizes are non-transferrable. Winning consumer is responsible for all local, state and federal taxes.

**12. SECOND CHANCE SWEEPSTAKES:** There are two Second Chance Sweepstakes drawings scheduled to be conducted on December 31, 1986 and February 28, 1987. Random drawing from all entries received by December 30, 1986 will award trip for two to America's Cup Races (or \$10,000). Random drawing from all entries received by February 28, 1987 will award two (2) Suzuki 4W Samurai (or \$6,895). All remaining prizes that are unclaimed after February 15, 1987 will remain unclaimed. Send entry to: Second Chance Entry P.O. Box 870 Wilton, CT 06897.

If you have any questions concerning the Borland Instant Winner Game, call: 1-800-451-4471.

The Worldwide  
Programming  
Standard

# Turbo Pascal Programming!

**\$10.00 Scratch 'n Win Rebate!**

## Turbo Pascal® 3.0

"For the IBM® PC, the benchmark Pascal compiler is undoubtedly Borland International's Turbo Pascal," says Gary Ray of PC Week. We and

more than 500,000 other people around the world think Mr. Ray got that right. Since launch, Turbo Pascal has become the *de facto* worldwide standard in high-speed Pascal compilers. Described by Jeff Duntemann of PC Magazine as the "Language deal of the century," Turbo Pascal is now an even better deal than that—because we've included the most popular options (BCD reals and 8087 support). What used

Turbo Pascal now includes  
free 8087 support and BCD!

to cost \$124.95 is now only \$99.95! You now get a lot more for a lot less: the compiler, a completely integrated programming environment, and BCD reals and 8087 support—all for a suggested retail of only \$99.95. And with a Scratch 'n Win \$10.00 Rebate, you pay only \$89.95—which really is the "language deal of the century"! Minimum memory: 128K.

**\$10.00 Scratch 'n Win Rebate!**

## Turbo Database Toolbox™

A perfect complement to Turbo Pascal, because it contains a complete library of Pascal procedures that allows you to

search and sort data and build powerful database applications. Having Turbo Database Toolbox means you don't have to re-invent the wheel each time you write a Turbo Pascal program. It comes with source code for a free sample database—right on disk. The database can be searched by key words or numbers. Update, add, or delete records as needed. Just compile it and it's ready to go to work for you.

Suggested retail: \$69.95. With a \$10.00 Scratch 'n Win Rebate check back from us, only \$59.95! Minimum memory: 128K.

## SPECIAL PRICES! AMAZING VALUE! ACT NOW!

Save a bundle  
on our bundles!

SideKick and Traveling  
SideKick for only  
\$125.00 but only  
\$110.00 after a \$15.00  
Scratch 'n Win Rebate!

It's the Works! Everything!  
The whole electronic  
enchilada! It's the Jumbo  
Pack... Turbo Pascal  
3.0, Turbo Tutor 2.0,  
Turbo Editor, Turbo  
GameWorks, Turbo  
Graphix and Turbo  
Database. All 6 Turbo  
Pascal programs for only  
\$299.95—or only  
\$284.95 with a \$15.00  
Scratch 'n Win Rebate!  
That's about \$47.00 each  
and that's a deal!

Turbo Lightning and  
Lightning Word Wizard  
for only \$149.95! and an  
amazing \$134.95 after a  
\$15.00 Scratch 'n Win  
Rebate!

# Btrieve<sup>®</sup>

## The Programmer's Choice.

**W**hen you're serious about application development, there's just one choice for file management: Btrieve. With what *Computer Language* calls "near mainframe functionality"<sup>1</sup>, Btrieve sets the file management standard for PC applications. With Btrieve loaded in your PC, your programs can use simple subroutine calls to retrieve, store and update records.

**B-tree based for high performance.** Performance is all-important, especially as your database grows. That's why Btrieve implements the b-tree file structure—the fastest, most efficient method of accessing data.

**Interfaces to C, BASIC, Pascal, COBOL.** Don't waste time programming in awkward fourth generation languages! With Btrieve, simply use the languages you know best—and write applications the right way. Over 15 language interfaces available.

**Multi-user versions for LANs and Xenix.** When your applications need to network, count on Btrieve. A single version runs on all DOS 3 LANs, including IBM PC Network and Novell Advanced Network. Btrieve is also available for Xenix and multitasking operating systems such as MultiLink Advanced, Microsoft Windows and IBM Topview.

**Built-in security features.** Lock up sensitive data with Btrieve's password protection and unique data encryption scheme—especially useful in local area networks.

**Help is just a phone call away.**

Need technical support? You've got it! Btrieve users receive 30 days of unlimited phone support at no charge. This "Direct Connect" policy is renewable for a full year at low cost. And try SoftCraft's free bulletin board for technical tips, seven days a week.

**Thorough documentation, easy implementation.** Getting started with Btrieve is easy: the manual is packed with examples of every Btrieve function in BASIC, Pascal, COBOL and C.

**Database queries, report writing.** Add Xtrieve<sup>™</sup> to your Btrieve applications for a fully-relational DBMS. Xtrieve's menu-driven interface gives your users the on-line query capabilities they need—without programming. Add our report writer option to produce custom reports and forms.

**No royalties.**  
Need we say more?

**Fault tolerant.** Btrieve insures against database disasters. Two levels of fault tolerance guarantee data integrity during accidents or power failures—even if lightning strikes. No extra programming required.

# SoftCraft

P.O. Box 9802 #917 Austin, Texas 78766 (512) 346-8380 Telex 358 200

Suggested retail prices: Btrieve, \$245; multi-user Btrieve, \$595; Xtrieve, \$245; multi-user Xtrieve, \$595 (for report generation, add \$145 for single-user and \$345 for multi-user). Available from SoftCraft and selected distributors. Requires PC-DOS or MS-DOS 2.X, 3.X, Xenix. Btrieve is a registered trademark and Xtrieve is a trademark of SoftCraft Inc. <sup>1</sup>From *Computer Language*, November 1985.

Mass-Storage Mergers

76

## THE TOKEN-RING SOLUTION / J. SCOTT HAUGDAHL

IBM's long-standing commitment to token-ring technology is reaching fruition. The IBM Token-Ring Network offers many interconnectivity possibilities and provides a rich environment for present and future services and applications.

50

## MASS-STORAGE MERGERS / PETER G. AITKEN

Since the arrival 18 months ago of the first hard-disk card, combining a 10MB hard disk and controller on a single expansion board, several similar products have been introduced with as much as 60MB capacity. Eleven hard-disk cards are reviewed.

76

## Compatibility and Performance: TELECAT-286 / STEVEN ARMBRUST and TED FORGERON

Televideo's experience as a manufacturer of computer terminals is evident in its AT-compatible machine, the TeleCAT-286, which features an excellent, high-resolution monitor. Tests reveal a few, minor compatibility problems, however.

90

## DISPLAY ADAPTER BOTTLENECK / MICHAEL ABRASH

Because rapid screen handling is so important in graphics-oriented software, the AT programmer must understand the dynamics of wait states inserted by the display adapter. Otherwise, significant performance degradation can result.

104

## Realtime Systems: A MESSAGE-PASSING EXECUTIVE / GARY ELFRING

Quantum Software System's QNX, a UNIX-like operating environment that is used for developing realtime applications, is at its best in networked situations in which multiple PCs must interact with a common database in realtime.

126

## A DATA MANAGER FOR CUSTOM REPORTS / DAVE BROWNING

Our series on data managers presents two members of IBM's Personal Decision Series: Data Edition and Reports+. Working together, these two products give the application developer the ability to tailor generated report programs in BASIC.

# PRODUCTIVITY TOOLS

From Opt-Tech Data Processing

## Opt-Tech Sort™

**ALL NEW Version 3.0 features even faster sorting, record selection, output record reformatting, dBASE III files, comma delimited fields, and much more.** This high performance sort/merge/record selection utility can be used as a stand-alone program or called as a subroutine from most languages.

Supports unlimited filesizes, multiple input files and fixed or variable length records. Many special file types are supported including Btrieve and dBASE. Up to nine sort control fields (ascending or descending), all common data types supported. Output files can be combinations of full records, keys or pointers, subsets of the input file fields, and literal values.

Written in assembly language for **high performance**. Example: 4,000 128 byte records sorted to give key and pointer in 30 seconds. **\$149.**

## On-Line Help™

A comprehensive utility for adding help windows to your programs. It provides efficient utilities and routines for interfacing your programs with the help system routines and help message libraries.

Help windows are displayed in a fraction of a second. You have total control over the contents of the window, its size and its position on the screen, including the display and border colors.

On-Line Help can be interfaced with interpreted Basic and all popular compilers. **\$149.**

## Scroll & Recall™

Allows you to conveniently scroll back through data that has gone off the top of your display screen. Up to 27 screens of data can be recalled or written to a disk file (great for documenting systems operations).

Allows you to easily recall and edit your previously entered DOS commands and data lines without re-typing.

Scroll & Recall is very easy to use. It's a resident utility that's always there when you need it! **\$69.**

All programs IBM PC/XT/AT & MS-DOS compatible.

Visa, M/C, AMEX, Check, Money Order, COD or Purchase Orders accepted.

Quantity and Dealer Discounts Available

1985 AWARD FOR  
BEST COMPUTER MAGAZINE  
Computer Press Association

# Here's why you should choose Periscope as your debugger...

## You'll get your programs running fast.

"It works great! A problem we had for three weeks was solved in three hours," writes Wade Clark of MPPi, Ltd.

## You'll make your programs solid.

David Nanian says, "I can't live without it!! BRIEF, a text editor my company wrote, would not be as stable as it is today without Periscope."

## You'll protect your investment.

We won't forget you after the sale. You'll get regular software updates, including a FREE first update and notice of later updates. You'll get technical help from Periscope's author. And you'll be able to upgrade to more powerful models of Periscope if you need to. One Periscope user writes, "... your support has won over even the heart of this hardened programmer!"

# PERISCOPE

## The Periscope Company, Inc.

(Formerly Data Base Decisions)

14 Bonnie Lane, Atlanta, GA 30328, 404/256-3860

## You deserve the best.

Thousands of programmers rely on the only debugger that PC Tech Journal has ever selected as **Product of the Month** (1/86). You owe it to yourself to find out why, first hand.

## You can try it at no risk.

You get an unconditional 30-Day, Money-Back Guarantee, so you can't lose.

## Start saving time and money now — order toll-free, 800/722-7006.

Use MasterCard, Visa, COD, or a qualified company purchase order. As one user puts it, Periscope is "one of the rare products, worth every penny!"

Periscope I, software, manual, protected memory board and breakout switch .....	\$295
Periscope II, software, manual, and breakout switch .....	\$145
Periscope II-X, software and manual .....	\$115

Add shipping - \$3 US; \$8 Canada; \$24 elsewhere. Ask about air shipment if you can't wait to get your programs up and running!

**P.S.** Watch for Periscope III, the new hardware-assisted debugger with real-time traceback and breakpoints!

COMPUTER INNOVATIONS

C86 **PLUS**  
C COMPILER

C86 **PLUS**  
REFERENCE MANUAL

**SUPREMACY.**

C COMPIER

C86 **PLUS**

# SUBSTANTIATED.

## SUPREMACY

It's a bold claim. A claim we're prepared to stake our reputation on. And at Computer Innovations, we've always taken our reputation very seriously.

It's no industry secret that the competitive C Compilers are at the end of their optimization cycle — they're just about as good as they are going to get. C86PLUS begins where everybody else has left off. It's an entirely new technology based on artificial intelligence and advanced compiler design techniques. Designed with the serious programmer in mind, C86PLUS provides the ultimate development environment, matching unparalleled execution speed with a host of productivity features.

## FAST EXECUTION

- 20% faster than Microsoft C, version 4.0
- 70% faster than existing C86, version 2.3 (timings based on the classic sieve benchmark)

## ANSI C COMPILER FEATURES

- Register variables
- Structure assignment
- Function prototypes
- New type modifiers
  - near
  - far
  - signed
  - const
  - volatile
- Long double 80 bit floating-point
- Enumerator data types (enums)
- Extended preprocessor capabilities

## FULL CONTROL OVER COMPILE ENVIRONMENT

- Small, Medium, and Large memory models
- 8086/80186 and 80286 code generation options
- In-line 8087/80287 floating point
- 8087/80287 auto detect emulator
- Source level debugger support
- Wild-card compilation
- Make utility
- ROMable code
- Linkable with macro assembler output
- Intel-standard OMF object files
- Optional assembly language output
- Warning level control

## EXTENSIVE FUNCTION LIBRARIES FOR INCREASED PRODUCTIVITY

- Over 250 library functions
- Full ANSI C library
- Functional equivalents to most UNIX System V libraries
- Shared file and network support
- Low-level machine access functions
- IBM ROM BIOS support routines
- Fully compiled small, medium and large model libraries
- C library source code
- Run-time start-up source code
- Source code librarian
- Object code librarian

## MICROSOFT COMPATIBILITY

If you're a current Microsoft user, we invite you to consider this simple point. C86PLUS will recompile most applications developed using MS-C without changes to your source code. You'll find that your application runs much faster.

## PROVEN EXPERIENCE

In 1981, Computer Innovations and its founder, George Eberhardt, revolutionized the DOS programming world with the introduction of the first C Compiler for the PC called C86. Today, C86 boasts a satisfied and loyal user base of over 20,000 programmers worldwide. C86PLUS represents an extension of this expertise and reputation. It's backed with more than a decade of intensive research and development.

## PROVEN SUPPORT

Making the claim that C86PLUS is supreme is one thing, standing behind it is another. Computer Innovations has always offered timely and intelligent technical support, and this is an important customer service which we do not intend to change.

## CALL TO ORDER

The call is on us. For more information or to order call:

**"WE COULDN'T HAVE DONE IT WITHOUT ATRON'S HARDWARE-ASSISTED SOFTWARE BUGBUSTERS."** *Alphonse A...*

This is the city saved by the Atron bugbusters. Your city. Full of wizards, with hundreds of millions of dollars invested in wringing every ounce of intelligence and performance out of your PC. It used to be plagued with the toughest software bugs known to mankind.

The first and most difficult plague was impossible to trap with software debuggers. These were carnivorous bugs which randomly overwrote programs, data, even the debugger. Nastiest were the ones that slipped in once every few hours, or changed their behavior after each new compile. Forty days and forty nights of recompiling, *trying something else*, caused many a would-be resident of the city to run screaming into the wilderness, never to be heard from again.

Second came the plague of not knowing where the program was, or where it had recently been. This compounded the first plague: How could anyone know *what* caused the random memory overwrites? Add to this random interrupts and timing dependencies, and you begin to understand *The Fear* that gripped the city.

Then came the last plague, which brought the wizards to their knees before they even started debugging. Their towering programs consumed so much memory, there wasn't enough room for their symbol table, let alone debugging software. Even if they could get past the first two plagues, this one killed their firstborn software.

The Atron solution came as a revelation: Monitor every memory reference and every instruction executed, by adding a hardware board to the AT or PC with an umbilical probe to the processor.

The result? Wham! The PC PROBE™ and the AT PROBE™ saved civilization as we know it. The first plague was cured with PROBE'S hardware-assisted breakpoint traps on reading, writing, executing, inputting and outputting. These could be done on single or ranges of addresses, and could include particular data values. All in real time. For a mere software debugger to attempt this, a 1-minute program would take 5 hours to execute.

The second plague, not knowing from whence you came, was cured with PROBE'S real-time trace memory. The history of program execution is saved on-board, in real time. Once a hardware trap has occurred,

The third plague, not enough room for the debugging symbol table to be co-resident in memory with a large program, was cured with 1-megabyte of on-board, hidden, write-protected memory. System memory was then free for the program, keeping the symbol table and debugger safe from destruction.

When the job of bugbusting was done, the wizards used their PROBES as performance analyzers. So they could have both reliability *and* performance. So they could send only the best software into the field.

On any given week, at least nine of the top ten best-selling software packages on the Soft-Sel Hotlist come from Atron customers.

Ever heard of Borland? "Without Atron," says its president Philippe Kahn, "there wouldn't be a Side-Kick™, Turbo Lightning™ would be light-years away, and Turbo Prolog™ wouldn't be shipping today."

Ever use a spreadsheet? From Enable™ to Paradox™, their bugs were busted by Atron products.

Into DBMSs? Everyone from Ashton-Tate to Oracle owns at least one Atron bug-buster.

If you use a product from one of the companies in *The City*, you owe life as you know it to Atron. Our guess is that 99% of all PCs, XTs and ATs have at least one product debugged with Atron bug-busters.

We've written a complete tutorial on state-of-the-art bugbusting. And it's yours, free for the asking. Full of examples and illustrations, it will show you how the wizards work their magic.

If you're tired of suffering the wrath of program bugs, call Atron today. You could be busting bugs, and sales records, tomorrow.

20665 Fourth Street • Saratoga, CA 95070 • 408/741-5900

# The Printer Standards Gulf

*Blitzed by dozens of new models, the user still cannot be sure a printer's features will be exploited.*

The hype at Fall COMDEX was, I am sure you have already read, about 386 machines and 286 machines and laser printers and desktop publishing. What really grabbed me was the huge number of new printers introduced, including many dot-matrix devices.

I have to confess a certain disappointment, however. While I like many of the new printers, I see no progress being made toward better standards for this most important and ubiquitous peripheral device on the desktop. This is a problem for the end user who is confronted by a bewildering array of options but with no certain reassurance (unless the salesperson ignores the facts) that the printer will be compatible with his or her software.

The lack of standards is also a significant problem for the developer. Any software product must either target itself against the lowest common denominator (a text printer that can back-space) or deliver a multitude of printer drivers so that more advanced printer features can be exploited. This translates into a major support problem, as user after user calls the hotline asking for help: "I'm trying to print on my NOSPE XM-08 and..." The problem is exacerbated by laser printers, which typically offer a long list of fonts in a variety of styles and sizes.

When I first got involved with personal computing, the world of printers seemed to consist of a few daisy wheels and a lot of dot matrix printers made by Epson. Few options were available, and those that were tended to be expensive; the very popular GrafTrax ROM set that delivered all-points-addressable graphics to the printer represented a fairly high cash outlay compared with the price of the printer.

Software would arrive on my doorstep with the bold announcement that it supported the Epson MX-80. We reviewers of the IBM PC left no stone unturned trying to verify that the IBM PC

ILLUSTRATION • MACIEK ALBRECHT

Graphics Printer was, in fact, nothing more than an ivory-colored version of the MX-80. Soon software began to arrive with the bold announcement that it supported the IBM printer.

Suddenly, the floodgates opened. Dozens of printers burst forth, each promoting its own set of new features and enhancements, and each insisting that it properly emulated the Epson FX-80 or the Diablo 630. But therein lies the rub: most of the emulations were not perfect, often prompting the user to ask, "Why didn't I just buy the Epson in the first place?"

By now, the more recent market entries should have considered these compatibility issues, but, in fact, most have not, opting instead for proprietary schemes that further compound the problem. Is the HP LaserJet+ emulation in the Epson GQ-2000 and Okidata LaserLine 6 laser printers correct?

This leaves today's developer with little choice. For example, WordPerfect comes with 200 printer definitions and a program that allows the user (not the novice, though) to build a definition for an unsupported printer or modify any of WordPerfect's definitions as needed. The latest version, WP 4.2, comes with a program that explains how the company has defined each printer as to supported features and fonts.

A possible light at the end of this dark tunnel is Microsoft Windows. A big advantage for the software developer is that Windows-compliant programs can take advantage of the Windows virtual device interface. Thus, the program just writes to the printer without worrying about what kind of printer it is; Windows then translates to a driver that understands the specifics for the particular printer. Although this is helpful, it really just transfers the burden of device driver development from the application developers to the operating system developers or, hopefully, to the device manufacturer.

## FOUNDATIONS

What we need instead is a better base standard. Most printers today have a microprocessor controlling their operation, as well as memory. More memory, to hold character tables, fonts, or emulation programs, is not going to affect the cost of the printer by very much. If that's the case, then why don't we agree on a few simple features that would be included in every printer:

**Characters.** Let's agree that the IBM character set is a good one. It has, more or less, what we expect in positions 0 to 127. In the upper half, it includes foreign characters and a good set of line drawing characters for making simple

## NEW FACES

Since I last wrote in this space about our staff (November 1985), a few changes have occurred.

We continue our policy of requiring that our technical staff possess significant computer industry experience, and our recent additions are no exception. Jim Shields has joined us as senior technical editor concentrating on the many PC-to-mainframe issues that we will cover in the future. Jim came to us from the U.S. Nuclear Regulatory Agency and 16 years of government service in a variety of computer-related positions; he was five times honored with awards for performance and service. He holds an M.S. degree in computer science from the University of Maryland, a B.S. in physics from Indiana University, and is a member of Phi Beta Kappa.

Technical editor David Methvin is our principal investigator into local area networks. He holds B.S. and M.S. degrees in computer science from the University of Virginia and brings extensive experience in C, UNIX, and networks gained from a variety of technical positions. David received achievement and management performance awards while at General Electric and joins us from a local company where, as a senior member of the technical staff, he worked on the development of a digital voice and data communications network.

When we consolidated our offices and moved the art department from New York to Columbia, art director Ina Saltz declined to make the move. Her contributions to the magazine have been significant; our clear visual identity is her legacy.

Replacing Ina as art director is Paula Jaworski, who worked for eight years at *Baltimore Magazine*, most recently in the dual role of art director and production manager. She is a magna cum laude graduate of the Maryland Institute, College of Art and holds a bachelor of fine arts degree. We are delighted to have Paula, the product of an exhaustive recruiting effort, and we are confident she will continue our award-winning ways.

Our new art assistant is Maria Sese, a 1986 graduate of the University of Maryland with a B.S. in advertising design and a knockout portfolio.

On the copy editing side of the house, Susan Holly has received a richly deserved promotion to chief

copy editor. In addition to considerable responsibility on our regular issues, which could best be described as watching over every word we print, Susie was the managing editor of the *PC Tech Journal Directory*. A journalist by training with both bachelor's and master's degrees from Indiana University, Susie supervises our recently expanded copy editing department, which now includes two tremendously talented proofreaders, Bruce Ansley and Beth Wardlaw.

Beth has a master's degree in library science and a publications specialist certificate from George Washington University. Bruce, a recent transplant from Texas to Maryland, has a B.A. in English from the University of Texas at Austin, and extensive electronic typesetting experience.

I am delighted to announce the promotion of Carole Autenzio to the position of new products editor, a change we made last year. Carole continues as *PC Tech Journal's* primary liaison with vendors and public relations firms. She handles the flow of all press materials, as well as the actual products we review. More recently, Carole assumed the additional responsibility for the supervision of our lab, PCTECHline, and in-house computers.

Trish Ledbetter is my new assistant, who also fills the pivotal position of office manager for our Columbia facility. She was previously employed by the federal government where she gained 10 years of experience as secretary and administrative assistant.

We have a great team. It's the best way to make sure *PC Tech Journal* lives up to your expectations.

—WF

boxes. The set could probably be enhanced with just a few more characters and could suffer the deletion of a few, but, by and large, it is a suitable selection for most work.

**Character extensions.** Let's agree that the basic machine should include a facility for loading alternate characters, either as large sets or individually. Let's agree further that the mechanism should not disable the basic set, but simply extend it. Access to the extended characters should be easy to program and understand; it might involve set-switching commands or set-identifier prefixes.

**Fonts.** Let's agree upon a uniform method for loading and accessing fonts. This is certainly more complex than handling characters, but the reality is that it requires only memory for storage of the font and software to drive it. Access to characters in the font should be transparent—that is, once a font is selected, printing a character in the font should be the same as printing a character in the base character set.

**Styles and sizes.** Let's agree on a few basic styles (for example, italics, bold, and bold italics) and sizes (10, 12, and 17 pitch, with appropriate heights). In the basic printer, all combinations of these styles should be legal, with easy access to the features.

**Page mode.** Let's agree that even the simplest, dot-matrix printer is a page-oriented printer as far as graphics are concerned. Although the machine might not have enough memory actually to hold a full-resolution image, it should provide simple and intuitive ways to receive sizable chunks (larger than one line) of the image. Further, for real page (that is, laser) printers, landscape mode should not exclude anything in the base character set.

**Commands.** Let's agree to a simple command set for the base features and provide rational command sequences to invoke vendor-specific features. In other words, a specific escape sequence would always mean that the printer would enter the vendor's domain, within which the printer operates as that vendor wishes and not necessarily in accordance with the standard.

Building a printer in this manner would give the software developer a definite standard to which he may write with confidence, one that is richer than the ordinary text printer with backspace. It is getting to the point that software arrives with one program diskette and six diskettes full of printer drivers. Let's see if we can't find a way to whittle that down.

Guaranteed EGA Compatibility

Dr. Halo Zoom Window in EGA or "480" Mode

**Hardware  
Zoom/Pan  
Drivers  
(included)**

80 x 60 Lotus Spreadsheet in "480" Mode

Hercules Compatible

**FREE  
Enhanced  
Dr. Halo  
Package**

## Eva™/480 Solves the EGA Board Puzzle!

- Eva/480 Exclusive. 640x480, 16 colors from 64 color palette. Software support for MS Windows, Lotus, Dr. Halo, Halo based products and AUTOCAD®.
- Eva/480 Delivers state-of-the-art in "bulletproof" EGA compatibility. Any program for the IBM EGA will run on Eva/480. Includes 256K memory.
- Eva/480 Exclusive! 80x60 crystal clear spreadsheet with Lotus 1-2-3 in "480" mode.
- Eva/480 Delivers 132x44/28/25 text display in EGA mode. Support includes: Terminal emulation, VT100, 3278/79 MOD5, Lotus 1-2-3, Symphony and word processing.
- Drivers for zoom/pan work with any application program to provide a power EGA superset standard. Halo supports hardware zoom factors of 2x, 4x, 8x with total viewport access to display memory in both "480" and 350 (EGA) modes. Pixel editing in up to 64 viewport segments. Panning in zoom window.
- Total downward compatibility with Hercules™ Mono, IBM CGA.

- Parallel port standard.
- Incredible utility software support for Lotus, MS Windows, Dr. Halo, Halo-based programs, optional AUTOCAD®.
- Made in the USA with Tseng Labs custom VLSI ET2000 Series Chip Set. One Year Warranty.
- Dr. Halo utilizes advanced "480" mode resolution and zoom window/viewport superset. Complete customer support from Media Cybernetics.

\*AUTOCAD® Driver Optional \$49.99 (60 day introductory offer-FREE AUTOCAD® Driver)

**Monitors Supported:** IBM Mono and compatibles (Hercules & MDA modes), IBM Color and compatibles (IBM CGA & EGA modes), IBM Enhanced and compatibles (IBM EGA mode), NEC MULTISYNC (Eva/480 mode).

EGA is TM of IBM, EGA PAINT is TM of RIX, MULTISYNC is TM of NEC, AUTOCAD is TM of AUTODESK, WINDOWS is TM of Microsoft, PC/XT/AT is TM of IBM Corp. EVA/480 is TM of Tseng Labs, HALO is TM of Media Cybernetics, 1-2-3 is TM of Lotus Development Corp., HERCULES is TM of Hercules Computer Technology, VT100 is TM of DEC.

7. VISA and MasterCard accepted. COD available at an additional cost.

\*On all orders over \$100 to destinations east of the Rocky Mountains.

# BRIEF

THE PROGRAMMER'S EDITOR

# dBRIEF

THE dBASE PROFESSIONAL'S ASSISTANT

**"dBRIEF Turns BRIEF into the Smartest Editor dBASE Has Ever Known".**

DAVID IRWIN

## CUSTOMIZES BRIEF FOR dBASE III

Since its introduction, BRIEF has been sweeping programmers off their feet. Why? Because BRIEF has every feature they need. Now, with the introduction of dBRIEF, you can take advantage of BRIEF customized to become a complete integrated environment for development with dBASE III and III Plus, CLIPPER or dBase/III Compiler

## MORE EFFICIENT DEVELOPMENT

### Increase Your Productivity

Developing an application in dBASE can be quite a tedious process considering all that dBASE can't do. To compensate, some programmers use several utility programs that have to run separately, and then integrate the results into one application. This slows you down — you spend more time watching your computer than you do programming.

dBRIEF gives you a central core — a single work area with common commands and operational consistency.

Reviewers at BYTE, INFOWORLD, DATA BASED ADVISOR, and DR DOBBS JOURNAL all came to the same conclusion — BRIEF IS BEST. And now it has been customized for dBASE programmers with dBRIEF.

**System Requirements**  
dBRIEF requires BRIEF, version 1.32 or later, and IBM or IBM compatible hardware with hard disk media. At least 384k RAM, 512k RAM is recommended if you want to operate dBASE within dBRIEF, and 640k RAM is preferred. Floppy systems are not recommended.

## A SINGLE PRODUCTIVE ENVIRONMENT

Save time and reduce mundane work using dBRIEF. Without ever leaving the dBRIEF core you can:

- Generate dBASE code for interactive data entry by drawing the screen with BRIEF.
- Use the special "speed coding" libraries to write your programs with the absolute minimum number of keystrokes.
- Optimize your dBASE code.
- Compile a program (using Clipper or the dB/III Compiler) with 1 keystroke.
- Indent code automatically.
- View several files simultaneously.
- Automate line and column input for SAY and GET.
- Run DOS programs like dFORMAT and dCONVERT.
- Easily enter graphics characters.
- Select colors or video attributes for your screen.
- Customize dBRIEF to your needs.
- Modify the dBRIEF source code.

The screenshot shows two windows. The left window, titled 'agentlist.prp', contains dBase code for a program named 'AGENTLIST'. The right window, titled 'agentbas.str', displays a file structure for 'AGENTBAS.DBF' with columns for Field, Name, Type, and Length. The file structure includes fields like CON, NAME, AGENTLIST, AGENTFIRST, AGENTLAST, AGENTID, AGENTLAST, AGENTNUM, AGENTSS, AGENTSS2, AGENTSS3, AGENTSS4, AGENTSS5, AGENTSS6, AGENTSS7, AGENTSS8, AGENTSS9, AGENTSS10, AGENTSS11, AGENTSS12, AGENTSS13, AGENTSS14, AGENTSS15, AGENTSS16, AGENTSS17, AGENTSS18, AGENTSS19, AGENTSS20, AGENTSS21, AGENTSS22, AGENTSS23, AGENTSS24, AGENTSS25, AGENTSS26, AGENTSS27, AGENTSS28, AGENTSS29, AGENTSS30, AGENTSS31, AGENTSS32, AGENTSS33, AGENTSS34, AGENTSS35, AGENTSS36, AGENTSS37, AGENTSS38, AGENTSS39, AGENTSS40, AGENTSS41, AGENTSS42, AGENTSS43, AGENTSS44, AGENTSS45, AGENTSS46, AGENTSS47, AGENTSS48, AGENTSS49, AGENTSS50, AGENTSS51, AGENTSS52, AGENTSS53, AGENTSS54, AGENTSS55, AGENTSS56, AGENTSS57, AGENTSS58, AGENTSS59, AGENTSS60, AGENTSS61, AGENTSS62, AGENTSS63, AGENTSS64, AGENTSS65, AGENTSS66, AGENTSS67, AGENTSS68, AGENTSS69, AGENTSS70, AGENTSS71, AGENTSS72, AGENTSS73, AGENTSS74, AGENTSS75, AGENTSS76, AGENTSS77, AGENTSS78, AGENTSS79, AGENTSS80, AGENTSS81, AGENTSS82, AGENTSS83, AGENTSS84, AGENTSS85, AGENTSS86, AGENTSS87, AGENTSS88, AGENTSS89, AGENTSS90, AGENTSS91, AGENTSS92, AGENTSS93, AGENTSS94, AGENTSS95, AGENTSS96, AGENTSS97, AGENTSS98, AGENTSS99, AGENTSS100.

View your file structure while you program.

## PROGRAM EDITING YOUR WAY

A typical program editor requires you to adjust your style of programming to its particular requirements — NOT SO WITH BRIEF. You can easily customize BRIEF to your way of doing things, making it work naturally, intuitively. BRIEF can be used for any programming language. Even without dBRIEF it provides:

Full UNDO (N Times)  
Multiple files, Unlimited size  
Language sensitive user controllable features  
Exit to DOS inside BRIEF  
Uses all available memory  
Keystroke Macros  
Reconfigure keyboard  
Windows  
Regular expression search  
Horizontal scrolling  
Comprehensive Error Recovery  
Programmable Macro Language  
EGA and Large Display Support  
Compile within BRIEF  
Adjustable line length — up to 512

*"[dBRIEF] acts as the central command post for writing and editing dBASE programs with BRIEF, but it does much, much more to increase your productivity."*

— PC Magazine, July 1986

## MONEY-BACK GUARANTEE

Try BRIEF and dBRIEF (\$275) for 30 days — if not satisfied get a full refund. If you already own BRIEF, buy dBRIEF for only \$95.

CALL (800-821-2492)

## A SAFE PORT

"Beyond COM2," Augie Hansen's review of multiport boards for the PC (September 1986, p. 68) was excellent. Mr. Hansen obviously researched the subject well and diligently tested each board. The article was extremely informative, and both Mr. Hansen and *PC Tech Journal* are to be commended.

I believe that the information as it was presented is a fair assessment of the boards included. However, between the time the article was begun and when it was completed, several improvements were made to the HOSTESS board from Control Systems. These changes should be mentioned so that a better comparison can be made.

First, table 1 listed DOS, QNX, and SCO XENIX compatibility. HOSTESS is also compatible with IBM XENIX 1.0 and 2.0, THEOS, VENIX, PICK, PC/RTX and AT/RTX, INETCO Coherent, and OPUS V. Many of these have drivers built-in for the HOSTESS.

Second, the article stated that, "No driver software is sold with the board itself." Up until April 1986, Control Systems sold either a DOS driver or an IBM XENIX 1.0 driver *if* the customer requested it. Since that date every HOSTESS board is shipped, according to the customer's request, with either a DOS driver (HOSTBUFFER) or IBM XENIX 1.0 driver, at no charge. A XENIX 2.0 driver has been available since August 1986 and is also included at no charge when ordered with a HOSTESS board. Each of these drivers costs \$20 when ordered separately.

Finally, no mention was made of the different interfaces and/or connectors provided with HOSTESS. They are as follows: RS-232, 25-pin, male or female; RS-232, 9-pin, female (a male version will be available soon); selectable RS-232/Current Loop, 25-pin, female; RS-422/485, 9-pin, female; and, to be released soon, a selectable RS-232/RS-422, 25-pin, male or female.

I feel that the HOSTESS board is more fairly represented given the above information. Thank you for this forum.

Walter J. Stull  
Control Systems, Inc.  
St. Paul, MN

## TAKEN TO TASK

With regard to Jim Roberts' review of TAS-Plus version 2.04 in the October 1986 issue ("A Data Manager for the Self-Reliant User," p. 146), I would like to make the following response:

First, I would like to keep our comparisons in one arena. We compare our product to dBASE III PLUS, not Oracle or Progress. No, we do not have automatic data-recovery facilities, but then, neither does dBASE. Mr. Roberts mentions throughout the article that certain actions may have catastrophic effects on the data. This is not quite true.

TAS-Plus uses the facility that DOS offers to open duplicate handles and close them without affecting the original handle. This has the effect of forcing the buffers to the disk and updating the directory information after each write so that should the system fail, the data are maintained. This works very well. In fact, even when I have been debugging the program and have aborted in the middle without exiting properly, the data I entered just before I quit were still there—including the keys.

In response to Mr. Roberts' complaints about burying references in the documentation, I submit the following: on page 148 (of the article), he remarks that a "crucial warning has been thoughtfully buried." That warning had to do with allowing fields to contain negative numbers. The main heading for that section (in our documentation) is "Conventions in TAS-Plus Programming and Documentation." The subchapter heading is "Fields." A reference is made to "Fields" in the index for the same page. We refer to fields early on and often in the documentation.

Mr. Roberts also states that he had problems with the structure rules (or block rules, as he calls them). However, he simply needs to understand how to use braces in denoting the structure. Our reference section for those commands refers to a tutorial chapter that states very plainly that you may not do a `goto` or `gosub` into the middle of a structure. (We work constantly on improving our documentation. A new manual will be issued in the near future. In the interim, improvement is accomplished through errata sheets.)

Many of Mr. Roberts' complaints have been fixed in the 2.06 release, which we began shipping in early October 1986 to all registered users.) This release includes the ability to print file schemas and to add new fields to the middle of an existing schema; changes also were made to the screen editor and new commands were added.

I designed TAS-Plus as a business programming tool. (TAS is an acronym for "the accounting solution.") It is intended to be an alternative to dBASE and all of its clones: a program with enough power to create sophisticated or simple business programs that could be used by novice or accountant.

Mr. Roberts skims over many of our unique features. In what other fourth-generation language could you write source-code editors, screen editors, and browse utilities? You can have a different help message available at each entry location. And you can open 32 files in the developer version—that means 32 master and 32 key files (16 in the base TAS-Plus version). No, we do not include many scientific number-crunching features. This program was not designed for those purposes.

The proof of our success is in our sales. We have sold more than 10,000 copies of the product. The number of people who have written to state their satisfaction with the product is heartening. These people range from novices

who have never programmed in any language to sophisticated programmers.

In closing, I would like to thank Mr. Roberts for the kind words he had to say about me. I will continue to improve on this product and keep it in a price range that anyone can afford.

Philip D. Mickelson, president  
Business Tools, Inc.  
Bellevue, WA

*As we stated at the outset of our series on data managers, we review one product at a time rather than comparing many products at once. Each product is reviewed against a set of criteria we considered important in an ideal data manager, rather than against any existing product. Progress and Oracle were referenced merely as examples of products that provide desirable data backup and recovery features.*

—JS

*Mr. Mickelson misses the point, as does the documentation, on the use of compound statements ("structures"). Transfers entirely within a compound statement are allowed in every structured language I know, except that of TAS. Worse yet, as is often the case in TAS-Plus, no diagnostics are produced by*

*the compiler when this unusual restriction is not observed.*

*I hope Mr. Mickelson is correct that many of the problems I encountered with TAS-Plus have been fixed in version 2.06; however, I have not as yet received a copy of this release, even though I am a registered user.*

—Jim Roberts

### HE LOST HIS MEMORY

I have been using Logitech's Modula-2 system for a short time, so I was interested in your September 1986 article ("Modula-2/86 Base Language System," Product Watch, John T. Cockerham, p. 187). Unfortunately, your reviewer overlooked one major problem: the Modula-2 is a memory hog.

I have had frequent problems with the compiler aborting in the middle of a compilation, reporting that it is unable to load one of its overlay files. After some investigation, I concluded that this is because of Modula-2's poor memory management. Over the course of several edit-compile-edit cycles, Modula-2 consumes so much memory that not much room is left for overlay.

To test, I loaded a file consisting of a MODULE declaration, a four-line comment, and an END declaration (with

Modula-2 reporting 214KB available memory). I typed in the same comment again, so that I ended up with two copies of the comment in the program. Modula-2 then reported 151KB available. I tried to compile the program, and Modula-2 was unable to load the overlay file. After failing to compile, it reported 150KB available. I tried to compile again and Modula-2 consumed another 1KB of memory.

After I saved the file to disk I exited to DOS. DOS reported that the file was 736 bytes long, but it tied up 65KB of memory when the file was created in the editor and compiled twice. Upon reentering Modula-2 and reloading the file, Modula-2 reported 214KB available, finally agreeing that this was a small file. Then it compiled the file with no problems.

Modula-2's editor does a terrible job of managing memory when it is inserting text in the middle of a file. The only way around this problem that I have found is to exit the program and restart it. That gets you back to a small file that then can be edited until it again gets too large to handle.

This is more an annoyance than anything. But it makes me wonder about the quality of the rest of the

## COBOL on UNIX...

...including AT&T, NCR, ALTOS and the IBM RT PC! Micro Focus' UNIX products let you develop, test and run multi-user applications on these and many other machines.

GSA certified Level II COBOL/ET includes features like extended addressing for large applications and native code generation for extremely fast programs. The world famous ANIMATOR, a visual programming tool, helps debug your COBOL applications quickly and easily. Convert your R/M COBOL programs for faster, easier-to-maintain code with Micro Focus' Upgrade III. Call now to find out how to increase your programming productivity!

# YOU ARE ABOUT TO BE SEDUCED BY POWER AND MONEY.

Admit it. You're intrigued with the idea of C programming. You may be working in BASIC, Pascal or Assembler now. But you're drawn to the power, portability and flexibility of C. And if money is what motivates you, imagine having it all for just \$75 with Mark Williams Let's C.®

## EVERYTHING YOU COULD ASK FOR IN A C COMPILER.

Let's C is no mere training tool. It's a complete, high quality C compiler. With the speed and code density to run your programs fast and lean. It won't get you sidetracked on some quirky aberration of C; Let's C supports the complete Kernighan & Ritchie C language—to the letter. And it comes from the family of Mark Williams C compilers, the name chosen by DEC, Intel, Wang and thousands of professional programmers.

## POWERFUL UTILITIES ARE A REAL BONUS

Let's C doesn't stop with being a high performance C compiler. It includes utilities you'd expect to pay extra for—like a linker and assembler plus the MicroEMACS full screen editor with source code included. Having the source code not only allows you to customize the editor, it offers a close up, fully commented view of C programming at its best.

## REVIEWERS ARE SOLD ON LET'S C, TOO.

"Let's C is an inexpensive, high-quality programming package...with all the tools you will need to

### Features

- For the IBM-PC and Compatibles
- Fast compact code plus register variables
- Full Kernighan & Ritchie C and extensions
- Full UNIX compatibility and complete libraries
- Small memory model
- Many powerful utilities including linker, assembler, archiver, cc one-step compiling, egrep, pr, tail, wc
- MicroEMACS full screen editor with source
- Supported by dozens of third party libraries
- Upgradeable to C Programming System for large scale applications development
- Not copy protected

Let's C Benchmark Done on an IBM-PC/XT, no 8087.  
Program: Floating Point  
from BYTE, August, 1983.

Exec Time in Seconds

**60 DAY MONEY BACK GUARANTEE**

create applications."

—William G. Wong, *BYTE*, August 1986.

"Let's C is a thoroughly professional C environment loaded with tools and programming utilities...another fine Mark Williams product."

—Christopher Skelly, *COMPUTER LANGUAGE*, February 1986

"The performance and documentation of the \$75 Let's C compiler rival those of C compilers for the PC currently being sold for \$500... highly recommended..."  
—Marty Franz, *PC TECH JOURNAL*, August 1986

## ADD THE *csd* DEBUGGER AND CUT DEVELOPMENT TIME IN HALF.

Invest another \$75 and you've got Mark Williams revolutionary source level debugger. *csd* lets you bypass clunky assembler and actually debug in C. That's a big help when you're learning C and indispensable when you're programming. *csd* combines the interactive advantages of an interpreter with the speed of a compiler, slicing development time in half. This is how Byte Magazine summed it up: "*csd* is close to the ideal debugging environment." William G. Wong, *BYTE*, August 1986

## ARE YOU STILL RESISTING?

If there's any doubt that now's the time to get your hands on the power of C, consider Mark Williams 60-day money back guarantee. You can't lose. But with Let's C and *csd*, imagine what you could gain.

Ask for Let's C and *csd* at your software dealer's, in the software department of your favorite bookstore, through the Express Program at over 5500 Tandy stores or order now by calling 1-800-MWC-1700.\*

CIRCLE NO. 205 ON READER SERVICE CARD

code, and, in particular, about the accuracy of the code created by this compiler. I haven't junked Modula-2 yet, but I am looking forward to the arrival of Borland's Modula-2 system.

Peter J. Becker  
Moscow, ID

*Mr. Becker is correct in his description of the behavior of the MOD editor. The editor slowly consumes free memory during its operation. Any user can verify this by pressing Alt-F1, which reveals*

*the current amount of free memory. The compiler needs at least 56KB free to run. If it does not have enough memory, it usually will complain about a heap or stack overflow.*

*To distinguish between a poorly written heap manager and a poorly designed editor, the heap management modules in Storage, which presumably form the basis of the editor's memory management code, were tested again. The test programs demonstrated Storage to be working perfectly.*

*After the review was written, I too ran out of memory once and MOD terminated most ungracefully, leaving behind a significant amount of work unsaved. Logitech admits that the fault lies with the MOD editor and has developed a fix, which will be included in the next release of the product.*

*This style of memory management design is not unique to MOD. Microsoft's Word also consumes memory during its operation. But Word's memory consumption is inapparent, because the user has no way to track free memory and does not know that the resource is exhausted until Word tells him to SAVE.*

*I would counsel against implying that the inadequate design of an editor reflects on the correctness of the underlying generated code. I find the Logitech code to be reasonably good, lacking only in the high degree of optimization found in some C compilers. As for Modula-2 from Borland, no forecast can be made regarding the debut of that product for the IBM PC.*

—John T. Cockerham

## Bringing It All Together

### VAX and UNIX CONNECTIVITY

The Syntax SMBserver is high performance local area network software for minicomputers and super microcomputers.

The Syntax SMBserver is fully compatible with Microsoft **MSNET**, IBM **PCNET**, Ungermann-Bass **NET/ONE**, and 3Com **3Plus** LAN products.

The Syntax SMBserver Advantage:

- IBM PCs (and compatibles) can be integrated into the same LAN with DEC VAX/VMS and UNIX standard computers.
- Supports industry standards (Ethernet, SMB, XNS, TCP/IP).
- PC files (including spreadsheets, documents, data bases, programs, etc.) can be easily and concurrently shared among PC users.
- Minicomputer server peripherals can be used in addition to, or in place of, PC peripherals.
- PC applications can share files with VMS or UNIX applications.
- The PC client workstations have access to the powerful file systems, multi-processing capabilities, and database management facilities of the server host.

### VMS CONNECTIVITY

The VAX computer can host a network of IBM PCs and DEC Rainbows. The Syntax VAX Interface Manager (VIM) allows DEC VAX and MicroVAX computers, IBM PCs (and compatibles), and DEC Rainbows to work together in a high-performance Ethernet Local Area Network (LAN).

VIM Benefits include:

- MS-DOS file service
- MS-DOS print service
- PC electronic mail
- File transfer between PCs and the VAX
- DECnet interface
- Network virtual terminals — VT100, VT220 from Walker Richer Quinn
- Program-to-program communications

Dealer and OEM inquiries welcome.

### ON THE RIGHT TRACK

Thank you for your thorough review of nine-track tape subsystems in the August 1986 issue ("Nine-track Tape Systems," Roger Addelson, p. 94). We at Overland Data feel that our tape subsystem was given a fair appraisal and was shown as the fine product that it is.

Mr. Addelson pointed out correctly that our tape archive program lacked an archival-select option, and that our data interchange software did not support labeled tapes. At the time of the product's review, this was true.

Since that time, Overland Data has released **FLASHBAK**, a new backup product for our nine-track tape subsystem package. In addition to a window-oriented interface, it features an archival-select option. **FLASHBAK** also offers a tree display of the DOS hard-disk file system, file-oriented backup and retrieval, and various selection and deselection criteria for backup and restore. It supports multivolume tapes and provides copy and remove functions for general file system support.

We also are releasing an enhanced data interchange program that supports labeled tapes and configuration translation tables. This program also allows record and field manipulations.

Since the review we also have enhanced our **XENIX** tape package to support the Berkeley **IOCTL** extensions. This feature allows **XENIX** programmers to write customized tape utilities when

# LOGITECH MODULA-2/86 HOLIDAY PACKAGE

**\$89 Price**

**\$199**  
**Special  
Holiday Offer**

- Separate Compilation
- Native Code Generation
- Large Memory Model Support
- Multitasking
- Powerful Debugging Tools
- Comprehensive Module Library
- Available for the PC and the VAX

Use LOGITECH MODULA-2/86 to decrease your overall development cycle and produce more reliable, more maintainable code.

## **LOGITECH MODULA-2/86** **\$89**

Includes Editor, Run Time System, Linker, 8087 Software Emulation, Binary Coded Decimal (BCD) Module, Logitech's comprehensive library, Utility to generate standard .EXE files. AND more!

## **LOGITECH MODULA-2/86 with 8087 Support** **\$129**

## **LOGITECH MODULA-2/86 PLUS** **\$189**

For machines with 512K of RAM.  
Increases compilation speed by 50%.

## **RUN TIME DEBUGGER (Source level!)** **\$69**

The ultimate professional's tool! Display source, data, call chain and raw memory. Set break points, variables, pinpoint bugs in your source!

## **UTILITIES PACKAGE** **\$49**

Features a Post-Mortem Debugger (PMD). If your program crashes at run-time the PMD allows you to analyze the status of the program and locate the error. Also includes a Disassembler, Cross Reference Utility, and Version that allows conditional compilation.

## **LIBRARY SOURCES** **\$99**

Source code now available for customization or exemplification.

## **WINDOW PACKAGE** **\$49**

Build windows into your programs. Features virtual screens, color support, overlapping windows and a variety of borders.

## **MAKE UTILITY** **\$29**

Figures out dependencies and automatically selects modules affected by code changes to minimize recompilation and relinking.

## **CROSS RUN TIME Debugger and ROM Package** **\$199**

Still available at an introductory price!

## **TURBO PASCAL to MODULA-2 TRANSLATOR** **\$49**

*"Turbo Pascal... is a very good system. But don't make the mistake of trying to use it for large programs."*

*Niklaus Wirth\**

Our Translator makes it even easier for Turbo users to step up to Modula-2/86. It changes your Turbo source code into Modula-2/86 source, solves all the incompatibilities, and translates the function calls of Turbo into Modula-2/86 procedures. Implements the complete Turbo libraries!

# Visual COBOL

It's a high performance native code COBOL compiler for IBM PCs.

It features the best integrated screen management system available in a micro-based COBOL compiler.

It comes with the fastest COBOL sort you can get on an IBM PC.

It produces some of the fastest executable code generated by a micro-based COBOL compiler.

It comes with the most comprehensive COBOL documentation available.

It was developed by a company committed to service and support AFTER the sale.

It's priced at only \$1150 and it's available now!

To learn more about Visual COBOL, contact mbp today. Call

## LETTERS

they require enhancements to the standard XENIX tape commands.

*Bob Long, president  
 Overland Data, Inc.  
 San Diego, CA*

I am writing to address some oversights in Roger Addelson's review of Emerald Systems' one-half-inch, nine-track, micro-to-mainframe package.

First, our Tape Import/Export (TIE) software package requirement for using a record structure file is designed for use as an application package. The capabilities of this conversion tool extend far beyond mere EBCDIC/ASCII translation and can be used on disk-to-disk transfers as well. In addition, if one were to use no record format specification at all, the incoming tape data will become a continuous file suitable for the standard hashing algorithms used in many high-level language compilers. This important flexibility, and direct portability to comma-separated-variable (CSV) format for dBASE, Lotus 1-2-3, and other popular packages, turn the TIE "limitations" (to use the reviewer's word) into one-of-a-kind features that enhance actual intended usage of a nine-track subsystem.

Second, Emerald is and always has been fully compatible with all Novell networks, backing up or restoring all Novell files, including hidden, system, and read-only, while users are logged into the network. We also maintain security/trustee integrity for directories, user, and bindery files (Novell system security files), saving the network administrator time usually spent recreating the LOGIN IDs and user default environment after a severe disk crash or failure. Emerald does not use NetWare's LARCHIVE/LRESTORE standard interface, thus, we are able to back up and restore between network and non-network (stand-alone DOS) systems. Novell has certified our ASP backup/restore software for compatibility and has purchased our nine-track unit for its in-house conversion needs.

Third, Emerald does provide an installable device driver, documented for the serious user. The documentation also contains a complete C language #INCLUDE library of all tape functions.

Finally, no mention was made of our conversion speed of 3.3MB per minute (three times faster than the competition due to the use of dual DMA channels, and buffer allocation). Nor did the author mention that our interrupt request line and DMA channel are completely software-selectable,

requiring the user to configure the controller only if a nonstandard I/O port address is required.

*Michael A. Bollinger  
 Emerald Systems Corporation  
 San Diego, CA*

## UTILITY WORK

This letter is in response to the review of "The Nibbler" that appeared in the July 1986 issue (Product Watch, Tom Swan, p. 167). We at Tachyon were disappointed by the overall negative tone of the review, and we do not understand why the reviewer chose to dwell on many of the product's least important features while overlooking many of the more useful operations.

First, the term "bug-ridden" is used to refer to what are later described as two errors and some complaints about the program's design. Bugs usually denote some failure to operate correctly. Although The Nibbler most likely has its share of the pesky critters, the only real bugs mentioned were with the File Map that hung on the file IBMBIO.COM only on the master diskette, and a p-System copy function that had already been corrected in the latest version (2.2).

In the third paragraph, Mr. Swan lists many of The Nibbler's features but ignores perhaps the most useful and speedy asset. I find the file, disk, and memory search functions to be extremely handy. It is unfortunate that these were not mentioned. Also overlooked were the two versions of the program that load and run at opposite ends of a machine's available memory. This feature allows the user to access data in either low or high memory without overwriting it.

The Nibbler's on-line help is extensive enough that we contemplated not producing a manual. Mr. Swan's point about the index, or lack of it, is well taken, and an index will be added. I also agree that the ability to label disks is awkward. But since DOS 3.x offers a command to label disks, Tachyon turned its attention to implementing other features that seemed more critical. I do wonder why most of a paragraph was spent pointing out such a small and trivial grievance.

Later, The Nibbler is deemed "unacceptable" because it hangs when attempting to map the IBMBIO.COM and IBMDOS.COM files on the master diskette. If the instructions had been followed for installing a bootable DOS system on The Nibbler diskette, there would not have been a problem with the File Map. (These files do not actu-

## **WINDOWS FOR DATA™**

# **The first choice of professional C programmers**

**"Windows for Data is the best  
programming tool I've ever used.  
It's the most flexible I've seen.  
Whenever I've wanted to do something,  
I've been able to find a way."**

Steven Weiss,  
Stratford Systems

Professionals choose our tools because they are designed, crafted, and supported for professionals. Here at Vermont Creative Software, we understand that performance and pleasure in programming derive from more than a long list of functions. **Windows for Data** provides:

### **PROFESSIONAL FLEXIBILITY:**

Our customers repeatedly tell us how they've used WFD in ways we never imagined - but which we anticipated by designing WFD for unprecedented adaptability. Virtually every capability and feature can be modified to meet special needs. You will be amazed at what you can do with WFD.

### **PROFESSIONAL PERFORMANCE:**

Screen output is crisp and fast. Windows, menus, and data-entry forms snap up and down from the screen. WFD is built upon and includes **Windows for C**, the windowing system rated #1 in speed and overall quality in PC Tech Journal (William Hunt, July 1985).

### **PROFESSIONAL RELIABILITY:**

An unreliable tool is worse than no tool at all. VCS products are known in the industry for their exceptional reliability. Ask anyone who owns one.

### **PROFESSIONAL DOCUMENTATION:**

Over 600 pages of documentation provide step-by-step explanations for each major application, a reference page for each function, listings of functions alphabetically and by usage, and a fully cross-referenced

index. Extensive tutorials and demonstration programs assist learning.

### **PROFESSIONAL TECHNICAL SUPPORT:**

The same expert programmers that develop our products provide prompt, knowledgeable technical support.

### **PROFESSIONAL PORTABILITY:**

High-performance versions of VCS products are available for XENIX, UNIX, and VMS, as well as DOS. No royalties.

### **OUR CHALLENGE AND GUARANTEE**

If you have an application where no other tool can do the job, try **Windows for Data**. If it doesn't help you solve your problem, RETURN FOR A FULL REFUND. YOU MUST BE SATISFIED.

## **WINDOWS FOR DATA**

for DOS, UNIX, VMS ...

The complete windowing data entry, menu, and help system that does the hard job others can't — we **guarantee** it!

Pop-up data entry windows; field types for all C data types, plus decimals, dates, and times; auto conversion to and from strings for all field types; system and user supplied validation functions; range checking; required, must-fill, and protected fields; free-form movement; multiple-choice field entry; scrollable sub-forms. Branch and nest windows, forms, and menus.

Complete context-sensitive help system with pop-up windows and scrollable text.

Pop-up, pull-down, scrollable, and Lotus-style menus.

**NEW FOR DEBUGGING:** Exclusive **VCS Error Traceback System** automatically identifies the location and cause of program errors. Eliminates the need to code error checks on all function calls! **VCS Memory Integrity Checking** helps catch those hard-to-detect, memory-corruption errors.

**NEW FOR ERROR HANDLING:** Install your own error handler to be called whenever a function detects an error.

**NEW FORM LAYOUT UTILITY** simplifies form design.

# C, BASIC, Pascal, dBASE, Modula-2 Programmers

**Source Print** makes your job easier by clarifying your source code!

For the new low price of \$97, you get all these valuable time saving features:  
The Index (cross-reference) lists variables, functions, procedures, and fields. Structure Outlining draws lines around nested structures for you. Automatic Indentation keeps listings and source code uniform.

The Table of Contents lists functions and procedures. Key words can be printed in boldface. Functions and procedures can be extracted to build a new source file, or when printing. Multistatement BASIC lines can be split for readability. The easy-to-use menu requires no learning period. Scroll thru directories. Search for files containing a given string—great for finding that “lost” procedure.

**\$97.00**

**Tree Diagrammer** shows you the forest as well as the trees!

Our new TREE DIAGRAMMER, for only \$77, automatically prints an organization chart of your program showing the hierarchy of calls to functions, procedures, and subroutines. It's easy to see what's called from what.

Recursive calls are indicated.

Why not order these indispensable tools today? We ship immediately, and there's no risk with our 60-day money-back guarantee.

Order by phone or mail:

SOURCE PRINT and TREE DIAGRAMMER handle up to 50 source files and 60,000 program lines. For IBM PC and all compatibles, 256K.

## LETTERS

ally exist until the installation program SETUP.BAT is run.) The File Map command will work correctly with any file on a diskette that has its file allocation table (FAT) links intact. I do not feel this is “unacceptable.”

The Nibbler was undergoing development during the time of the review. This did cause us to delay several times in sending update review copies. This unfortunately came across as unreliable technical support. Perhaps some future version of The Nibbler will merit a further and more positive review.

A final note, The Nibbler and one other Tachyon product, a screen generator and menu manager called Screen-Pro, have been licensed to Olympus Software in San Diego from where they will be marketed nationally.

Steven Blake, president  
Tachyon Corporation  
San Diego, CA

*I appreciate that many products may undergo revisions after they have been reviewed. But I can review only what companies choose to send me. From all appearances, the version of The Nibbler that I received was a finished product. If this was not the case, Tachyon should have made that fact clear.*

*My criticism of the program for hanging while mapping IBMBIO.COM and IBMDOS.COM stands. I can accept no defense of a program—especially a programming utility—that causes my computer to crash. If Tachyon is aware of the cause of this problem, why doesn't it insert programming to prevent its occurrence?*

—Tom Swan

## ERRATA

The program PRF.ASM (listing 2), published with the article “An Execution Profiler for the PC” (Ralph G. Brickner, November 1986, p. 120), assembles correctly using version 4.0 of the Microsoft Macro Assembler (MASM); however, some older versions (including IBM MASM 2.0) will indicate phase errors when assembling this program. This can be remedied by replacing MOV DS:[20H], OFFSET NEW\_TIMER in the procedure REPLACE\_TIMER with MOV WORD PTR DS:[20H], OFFSET NEW\_TIMER. During the first phase of assembly, IBM MASM reserves only one byte in the MOV instruction for the offset of the forward referenced label NEW\_TIMER. During the second phase, two bytes are used for this value, thus changing the location of the next label and causing a phase error.

“here is possibly the ultimate source code printing utility.”

—Data Based  
July 1986

“Occasionally, a utility comes along that makes a programmer's life much easier. SOURCE PRINT is such a program. It contributes to the programmer's job by organizing code into a legible format and by helping to organize the documentation and debugging process.”

—PC Magazine  
Sept. 16, 1986

## We Go Out of Our Way to Serve Developers

Our technical support provides accurate information on the product categories you need to be more productive. And we recommend the products that are right for you. We offer unbiased advice, free literature, and guarantees based on our recommendations. Often we suggest products or approaches that you might not have thought of. We supply every product for developers of software on PC's and every significant product for other environments. Call one of our qualified representatives today. How could better development tools help you? Call us.

## FEATURE

**Tom Rettig's Library** - adds 140 functions to dBASE III Plus for arrays, character and data control, screen, new logical expressions, number manipulations, and much more. Full source (in C, assembler, and dBASE), no royalties. Use with Clipper. PC \$ 89

We support MSDOS (not just compatibles), PCDOS, Xenix-86, CPM-80, Macintosh, Atari ST, and Amiga.

# THE PROGRAMMER'S SHOP

provides complete information, advice, guarantees and every product for Microcomputer Programming.

## Special Features

### Multi-Language Screen Management

#### Senior Programmers: FAST, Flexible, Focused Screen Design Package Screen-Ace Form Master

Use a complete screen manager that concentrates on all the essentials. Fast accessible code gives you the power for creative design. Assembler code writes directly to video RAM making Form Master much faster than packages that generate high-level language source.

Paint your screens with the screen builder, and save them to a DOS file accessible with a single call, or define screens within your program at runtime — even combine the techniques for still greater power (lets you modify screens on the fly). Form Master supports an unlimited number of screens (with 512K RAM, you can define up to 64 25-line virtual screens).

Each screen can have over 2000 fields, and can be up to 16.5 physical screens in length; and you can use the same screen with each language. Use the default attributes (like reverse video, underline, etc.) or choose from any of 256 possible attributes.

Permits flexible function key definition, forms larger than the physical screen, toggling field colors and attributes at runtime, and allows you to switch between screens without losing any data. Modify screens whether or not they are being displayed. With Form Master you can generate screen or field-specific help screens.

Get a cleaner, FASTER user interface with Form Master.

Form Master is DESQview, TopView, and MS Windows compatible. Lattice, MS C (2.xx+) (all models of C supported), APL\*PLUS/PC, assembler — BASIC and Pascal soon. Call 818-989-5329 for a \$3 demo with tutorial.

PRODUCTS, INC.

PCDOS \$195

### Multitasking Technology

#### Multitasking, Windowing for C, Turbo Pascal, or dBASE or . . . in only 12K!

#### SYNERGY Development Toolkit

The highly efficient design of Synergy by Matrix gives you the benefits of powerful graphics, windows, pull-down menus, dialog boxes, sophisticated text and icon management, math support, multitasking, and SPEED, all for an incredibly small **12K RAM** requirement.

The Synergy Runtime provides character and graphics support for menus, windows, dialog boxes, and more, so you can write programs that work in either mode, with very reasonable, low runtime fees.

Functions include: window management with capabilities like tile and overlap, variable size and placement, process management, to support multitasking and sub-process generation, menus, dialog, and icon management, graphics, text (including a variety of fonts and sizes), and console management.

The Synergy Development Toolkit is a collection of sophisticated tools designed for software developers writing new applications using Synergy, or modifying existing applications to take full advantage of Synergy. Tools include: graphics resource editor for creating and modifying icons and text fonts, graphics resource compiler to construct and manage resource data files, font compiler and manager, debugging tools, sample library, and more.

Supports IBM or Microsoft Macro Assemblers, Turbo, IBM, and Microsoft Pascal, IBM and Microsoft BASIC, Lattice and Microsoft C, and dBASE II and III. CGA, EGA, and Hercules monochrome graphics support.

### Expert System Development

#### Expert System Development: Practical, Complete, and Unlimited Features Help Smoothly Build Expert Systems with EXSYS

EXSYS, Inc. has built a stable and complete toolkit by listening to users and examining what they need. One of the first Expert System Shells for the PC, EXSYS provides the features of just about all of its combined competitors, plus the documentation and examples you will need to learn in this field.

UNLIMITED FEATURES? EXSYS supports backward chaining of IF/THEN/ELSE rules, full math support, probabilities, explanations, the ability to call external programs including spreadsheets, database managers, or custom-written front ends with data passed to and from the external program, plus the ability to handle substantial applications of up to 5,000 rules. All user input is either English text, menu selection, or algebraic expression.

The systems developed can explain why information is needed and how it will be used. The ability to "change and rerun" allows expert system modelling of problems. Written entirely in C, EXSYS provides very high speed execution and efficient memory utilization.

But if these features are not enough, use the interface to Lotus, dBASE, BASIC, C, or any other .EXE or .COM file. Already in use at over 1,000 sites with many complex and powerful expert systems developed. Several expert systems have been marketed with a low-cost runtime license. Single computer use is only \$349. Unlimited runtime distribution is available for an additional \$539. Call (505) 836-6676 for \$15 demo.

**EXSYS**

PCDOS \$319

### Translator

#### dBASE Programmers: Translate to C with Less Effort. Use dBx Translator

Users say dBx:

— "allowed me to concentrate on learning C." —new C programmer

— "takes grunt work out of conversion."

—experienced C/dBASE programmer

If you need the portability, speed, and control of C, but all your code is written in dBASE, dBx is for you. Including a translator, C libraries and utilities, dBx produces a clean, maintainable translation of most of your programs. You complete translation then rewrite sections to take advantage of C power, flexibility.

Includes BTree, works with dB-C, CTree, C-Index, Phact, others. Supports C86, Microsoft, Desmet, and Lattice C. No royalties. Library source Unix portable, available separately.

Call our "translator specialist" for details.

PCDOS \$319

### Version Control

#### PROGRAMMING TEAMS: Manage and Control Source Versions Efficiently with POLYTRON Version Control System (PVCS)

Duplicated efforts and time wasted rebuilding and cataloging source can be avoided. Reliably delegate control for source & documentation to PVCS.

Save confusion and disk space by letting PVCS maintain the complete current version plus all of the increments, decrements, and related notes needed to rebuild any version. Maintains a complete history of changes. No experience with such a system is assumed. The documentation and examples will help you learn quickly. Privilege levels control access so the administrator knows who is working on each module. Ask about discounts for LAN and multi-keyboard access.

# Better BASIC

## NOW INTRODUCING VIRTUAL MEMORY SUPPORT

BetterBASIC with the optional Virtual Memory Manager can now address 400,000,000,000 bytes of memory!

### BetterBASIC Application Development System

**\$199.00**

The BetterBASIC Application Development System provides very close compatibility with PC-BASICA and GW-BASIC, yet provides numerous new and sophisticated language features such as: program Block Structures, recursive Procedures and Functions with local variables, structures, Records and Pointers and last but not least support of large memory.

#### Virtual Memory Manager

**\$99.00**

The Virtual Memory Manager expands BetterBASIC's data space into the giga-byte range and finally breaks the 640k byte barrier for array sizes. Not only can you directly address all expanded memory supported by LIM/EMS memory boards, you can also address any RAM Disk, Hard Disk or even a Floppy Disk as if they were ordinary RAM.

#### Btrieve™ Interface

**\$99.00**

This is a high level BetterBASIC interface to the ever popular Btrieve™ file manager from Soft-Craft. Instead of Assembly language calls this module provides high level BetterBASIC program access to all Btrieve™ functions. Use it to design your own database application in BetterBASIC.

#### Virtual Memory Manager- Network Version

**\$250.00**

This version of the Virtual Memory Manager allows Virtual Memory to be distributed throughout a Local Area Network. It also provides File, Records and Field Locking to control access to shared data.

#### 8087/80287 Math Module

**\$99.00**

This module allows you to use the 8087 or 80287 co-processor to significantly accelerate programs which are floating point calculation intensive.

#### C-Link

**\$99.00**

This software package allows BetterBASIC to access C-language library functions from within BetterBASIC. Currently supported are Lattice and Microsoft C.

#### Decimal Math Module

**\$99.00**

If you are a business programmer, you are probably frustrated by the many roundoff problems caused by ordinary IEEE format floating point numerical operations. The BetterBASIC Decimal Math Module which offers variable precision from 6 to 24 digits, drastically reduces roundoff problems in business applications.

#### Screen Design System

**\$199.00**

This package truly takes the drudgery out of creating display screens and data entry screens. An interactive Screen Editor lets you "paint" your display screens exactly as you want them to appear in your program. The completed screens take the form of disk resident images. A run time library module provides many new BetterBASIC procedures and functions for interacting with the display screens to simplify the use of pop-up menus and data entry screens.

#### BetterTools™

**\$99.00**

This is a collection of more than 150 useful extensions to BetterBASIC such as time and date computations, encryption and decryption, low level file directory access, hyperbolic function and much more. No BetterBASIC programmer should be without BetterTools™.

# SPECIFICATIONS

BetterBASIC is GW-BASIC and PC-BASICA compatible; runs on IBM PC and compatibles.

## HARDWARE REQUIREMENTS

CPU: IBM PC, IBM PC XT AT, COMPAQ, IBM PC Compatibles  
Memory: 256KB min up to 640KB  
Display: Monochrome or Color  
Disk Drive: One 5¼" floppy, single or double sided  
Operating Systems: MS-DOS 2.0, 2.1, 3.0, 3.1

## DATA TYPES:

### Numeric Data:

BYTE, range: 0 to +255  
INTEGER, range: - 32768 to + 32767  
REAL, range: Single Precision  $8.43 \times 10^{-37}$  to  $3.37 \times 10^{38}$   
Double precision  $4.19 \times 10^{-307}$  to  $1.67 \times 10^{308}$   
Binary Math, Single/Double/Mixed Precision  
Mixed mode numeric expressions will always be REAL.

### String data:

Variable from 0 to 32767 characters in size.

### Record Variables:

Allows grouping of dissimilar data types into a single logical variable. Elements of a RECORD are addressed as FIELDS and can be of any type, including ARRAY, RECORD and POINTER.

### Array Variables:

N-dimensional arrays of any type, including ARRAY, RECORD and POINTER. Dynamic arrays like PC-BASICA

### Pointer Variables:

Allows indirect reference to any data type. Can be used with RECORD variable to create linked lists, or to create relational data structures.

In addition supports PC-BASICA record types.

# Compaq Deskpro 386

*Compaq calls it the third major milestone in the history of personal computers; this may be more than pure hype.*

The IBM PC standard is pervasive in the industry. It has exceeded all expectations, including those of IBM. Now, with the creation of a new generation of microprocessors in the Intel 80386, an evolution of the standard is possible. Not content to stand by and wait until IBM decided to lead the industry into the next stage, Compaq Computer Corporation has forged ahead with the development of the Deskpro 386. The PC standard is no longer IBM's exclusively.

In recognition of Compaq's foresight and initiative, *PC Tech Journal* has named the Compaq Deskpro 386 as its Product of the Year for 1986.

Since 1983, Compaq has regularly demonstrated its ability to compete with IBM. Compaq is *not* noted for being a cheap clone manufacturer; the company has always produced a quality machine that sells for a premium price. Compaq has managed to continue its growth throughout the shake-ups that caused many manufacturers of compatibles to collapse. It not only is clearly established as the largest manufacturer of compatibles, but is now offering itself as a pacesetter as well.

Compaq's president and CEO, Rod Canion, calls the announcement of the Deskpro 386 the third major milestone in the history of personal computer technology—following the arrival of the Apple II and the introduction of the IBM PC. This statement represents a corporate confidence that probably would not be accepted from a company any less respected than Compaq.

The unveiling of the Deskpro 386 on September 9 was especially noteworthy in that this was not a machine to be produced sometime in the future, but was available the day it was announced. (*PC Tech Journal* was able to use and ultimately buy the machine for testing in its own laboratory.) Further, Compaq's announcement was accompanied by a statement of immediate

support by industry leaders for the development of hardware and software.

The Deskpro 386 offers compatibility with previous standards and allows a growth path to the future. The machine's success will not be due to any dramatic technological breakthroughs, but will be because all aspects of the current standard were examined and incorporated. This machine provides the new technology while retaining the old.

Many issues of compatibility must be considered in designing an IBM-compatible machine, and Compaq has achieved excellence by attending to these issues—at considerable expense. Throughout its development as a company, Compaq has devoted substantial in-house resources to testing all versions of Compaq machines and upgrades with all of the commonly available software and add-on devices.

One example of Compaq's fanatical zeal for compatibility is in its support of the IBM Token-Ring Adapter. IBM's own XT-286 requires a software patch to support the Token-Ring, but the Deskpro 386 has this support built in.

The Compaq BIOS has always been compatible and has kept pace with the evolution of the standard from its first introduction to the latest version. Compaq designs its own BIOS rather than buying it from a third party; this, together with its in-house research, gives the company a control over updates that is unmatched in the industry.

Through its series on AT compatibles, *PC Tech Journal* has become quite familiar with the subtle incompatibilities that can appear when testing computers. The Evaluation Suite designed for the series, "Out from the Shadow of IBM. . ." (Steven Armbrust, Ted Forgeon, and Paul Pierce, August 1986, p. 52) provides ample opportunity for incompatibilities to appear. To date, the Deskpro 386 that is being evaluated for an upcoming article has displayed no signs of nonconformance with the standards.

A strong company might be tempted to exploit all of the new features in a new microprocessor, encouraging the rest of the industry to drop its existing standards. Compaq, however, decided that its name was not strong enough to do this, and the state of the supporting technologies for the machine is such that the 80386 cannot be used to its full potential yet.

Compaq has made use of the state of the art where appropriate—for example, in its 32-bit memory system. Memory is the only current technology that allows the use of the 80386's 32-bit features. Compaq elected to maintain the 8-MHz AT bus and make the memory system interface proprietary by using a separate bus instead of setting a 32-bit bus standard for the industry. Although criticized for not taking the standard further, Compaq opted to retain a measure of security. Its choice assures that the existing machine will be compatible with any future IBM design that includes the existing standards, yet it provides a good migration path for power-hungry users who are clamoring for more, right now.

Although a new standard has not been set, Compaq has used the available memory in a novel manner. The 1MB of 32-bit memory that is supplied with the machine is used in the conventional manner for the first 640KB of memory, and the last 360KB is mapped into the area of memory immediately below the 16MB point. The system ROM BIOS and EGA BIOS are copied into this area, allowing all BIOS calls to be accessed at 16 MHz, 32 bits at a time. This is beneficial to EGA applications that use the BIOS calls and do not write directly to the screen.

Reasoning that no need exists for a 32-bit bus at this time, Compaq made the decision to put a 16-bit bus in the Deskpro 386 and run it at 8 MHz—an interim, but valid, solution. The 8-MHz bus is an example of the typically con-

servative nature of Compaq. The problem with simply boosting the speed of a machine, as many have done with the 12-MHz AT compatibles, is that the add-on boards do not work reliably on a 12-MHz bus. The add-on board manufacturers are not likely to change their designs to regain compatibility for the compatible manufacturers. Expecting the rest of the industry to redesign product lines is not a realistic solution. Tests run by *PC Tech Journal* indicate that the currently available add-on boards and peripherals appear to work acceptably only up to speeds of about 9 MHz. Therefore, the 8-MHz bus offered by Compaq does not present any compatibility problems.

Compaq, however, has gone a step further. In order to deal with the programs that require the speed of the disk drive to be controlled by an 8-MHz microprocessor (typically, those programs with a copy protection system that is based on timed parameters), Compaq has designed the Deskpro 386 so that it automatically slows down whenever drive A: is accessed, allowing all bootable disks that work on the 8-MHz AT to function correctly. This can be overridden by setting a MODE command.

Compaq's accommodation of existing standards is even more comprehensive. The speed of the processor, as seen by the application that is currently running in the machine, can be adjusted from 4.77 to 16 MHz. Rather than changing the CPU clock speed, the memory refresh cycle is extended. This is done by putting the microprocessor into the hold state for a preset period of time, thus achieving compatibility with even the most obscure program. This design, which illustrates the company's attention to detail, is a sophisticated implementation that ensures that direct memory accesses to the bus are not excessively delayed.

The hard disks used in the Deskpro 386 are state of the art but do not

necessitate a faster bus. The 140MB drive has an average access time of 19 milliseconds (ms), and even the base system has a very respectable 25-ms typical access time for a 40MB disk. Given the current state of the technology, this speed and that of the disk controller are too slow to benefit from a 32-bit bus, but they are the best currently available for a reasonable cost.

No existing graphics standards for the microcomputer market use a 32-bit architecture. The current state of the art is the EGA, an 8-bit based system. After considering the various paths that the standard may take, Compaq concluded that in all likelihood the next generation of graphics systems would be based on graphics processors such as the 82786 from Intel or the TMS34010 from Texas Instruments. Currently, predicting which system will become the new standard is impossible.

Although Compaq could have designed a 16-bit EGA to use existing standards, this probably would not be a worthwhile development in light of the 32-bit processor. Compaq, however, does make the existing standard work in the best way possible. It is to be commended for its innovative method of copying the ROM BIOS on the EGA card into the RAM, taking the information 32 bits at a time instead of 8, and accessing this data at 16 MHz.

The industry seems to believe that Compaq has made the right decisions and is leading the way into the future of

the 80386. Companies providing support for the Deskpro 386 with existing products include Ashton-Tate with dBASE III PLUS, AST Research with its Advantage! board, Hayes Microcomputer Products with its Smartmodem series, Lotus Development Corporation with 1-2-3, and Microsoft with Word. Microsoft also has announced XENIX System V/386, the first general-purpose operating system to take advantage of the 32-bit architecture of the 80386.

While other companies have announced 80386-based machines, none appears to have considered the full implications of the existing standard, and none has provided a means to reach new and better goals. Compaq offers compatibility for the present by using the 80386 in the AT-compatible mode, but it leaves room for progress as operating systems and applications that exploit the new processor are developed and become the new standard. The Deskpro 386 is a fine example of how Compaq can shape the industry with an existing standard that is bigger than originally conceived and by offering solutions for the future.

Hardware, software, and other developments for the IBM PC family

DC-8000 multifunction controller from Wespercorp

IBM 9370 Model 20 entry-level information system

## FROM IBM

**IBM Corporation** has announced the **IBM 9370 Information System**, a line of compact, mid-range computers that deliver System/370 processing power and mainframe architecture in the space of a file cabinet. Four models feature modular, rack-mounted components; air-cooled, thermal conduction modules; IBM's 1-million-bit-chip memory technology; and dense logic-circuitry packaging. The wide range of existing System/370 teleprocessing, networking, and communications systems management capabilities is augmented by the new IBM 9370 integrated controllers and LAN support. All processors in the 9370 Information System have a maximum memory capacity of 16MB. External storage is provided by the current rack-mounted IBM 9332 direct access storage device (DASD) with a maximum storage capacity of 400MB and by the current IBM 9335 DASD with 800MB. From \$31,000 for Model 20 with 4MB to \$210,000 for Model 90 with 16MB.

The **IBM 9347 Magnetic Tape Drive** is rack-mounted and uses stan-

IBM 9347 Magnetic Tape Drive

dard one-half-inch tape to provide backup, recovery, and interchange of data in streaming mode at 1,600 bits per inch. The IBM 9347 records data

at a tape speed of either 25 inches or 100 inches per second. \$7,900. *IBM Corporation, Information Systems Group, 900 King Street, Rye Brook, NY 10573; 800/426-2468*

CIRCLE 311 ON READER SERVICE CARD

## HARDWARE

A high-performance, multifunction controller for the PC, PC/XT, PC/AT, RT PC, and compatibles has been announced by **Wespercorp**. The **DC-8000** multifunction controller combines an SMD controller with a small computer system interface (SCSI) host adapter on a single, standard-sized PC board. Intended for the OEM market, the DC-8000 allows the systems integrator to configure a PC with up to two high-performance SMD disk drives and to integrate as many as eight SCSI-compatible tape or laser optical drives and other peripherals. Some of the features that are supported by the DC-8000 include: overlapped seeks, 32-bit error-correcting code (ECC) with 11-bit error correction, variable sector interleaving, and media-defect mapping by sector. \$1,715.

*Wespercorp, 1821 E. Dyer Road, Santa Ana, CA 92705; 714/261-0606*

CIRCLE 323 ON READER SERVICE CARD

The **MotherCard 5.0** from **SOTA Technology, Inc.** turns a PC into a PC/AT-compatible computer. The MotherCard is a full 80286-based computer on a full-length board that plugs into a PC expansion slot. The MotherCard has an 80286 (8- or 10-MHz) microprocessor and comes standard with 640KB of DOS memory, 320KB of expanded memory, a realtime clock, and a socket for the 80287 (5-, 8-, or 10-MHz) numeric coprocessor. A daughterboard connector allows later expansion to 16MB of memory. The 8088 on the PC motherboard is removed and plugged into a socket on the MotherCard. A cable then runs from

the empty 8088 socket on the motherboard to the MotherCard. The user can switch back to 8088 by entering a simple, DOS-level command. When in the 80286 mode, all software programs are executed from the fast zero- or one-wait-state DRAM. \$995.

*SOTA Technology, Inc., 657 N. Pastoria Blvd., Sunnyvale, CA 94086; 408/245-3366*

CIRCLE 320 ON READER SERVICE CARD

**American Computer & Peripheral, Inc.** has announced the **386 TURBO**, an accelerator card that uses the Intel 80386 to bring a 6-MHz PC/AT up to 12-MHz speed and an 8-MHz AT up to 16-MHz. Clock rates are switchable via software without a system reboot. The 386 TURBO has a 1MB cache memory with a 100-percent cache hit rate. The cache memory responds to all write operations in the lower megabyte of the system memory map. Read operations from cache memory may be enabled or disabled through software in three memory segments: main, video, and ROM BIOS. \$1,995.

*American Computer and Peripheral, Inc., 2720 Croddy Way, Santa Ana, CA 92704; 714/545-2004*

CIRCLE 313 ON READER SERVICE CARD

**Chips and Technologies, Inc.** has introduced the seven-chip **CS 8230 AT/386 CHIPset** for Intel 80386-based, 32-bit microcomputers. The CHIPset, combined with the recently introduced **82C206 Integrated Peripherals Controller (IPC)** chip, lets users configure a PC/AT-compatible system board with a total of 40 chips, plus memory. The seven chips include one bus controller chip, one page/interleave memory controller chip, two address buffer chips, two data buffer chips, and one miscellaneous control logic chip. Also announced was a development kit for the AT/386 CHIPset, **DK 8230**, which includes a development board, a data

Quadram's Quad386 XT enhancement board for the PC/XT

PC/AT-compatible Premium/286 from AST Research, Inc.

sheet, a user's guide, and data book for the CS 8230 CHIPset. CS 8230 CHIPset, \$196.40; 82C206 IPC, \$49.00; DK 8230 Development Kit, \$2,995.00.

*Chips and Technologies, Inc., 521 Cottonwood Drive, Milpitas, CA 95035; 408/434-0600*

CIRCLE 314 ON READER SERVICE CARD

**Quadram Corporation** has announced an enhancement board that delivers the power and functionality of the 80386 to the PC/XT. The **Quad386 XT** occupies a single slot in the XT and features an 80386 16-MHz microprocessor, 1MB of true 32-bit memory using 256KB DRAM, and 2MB of memory upgrade on an optional daughterboard. The Quad386 XT also provides on-board support for an 80287 numeric coprocessor, 96KB of image memory, and 32KB of direct cache memory. \$1,495.

*Quadram Corporation, One Quad Way, Norcross, GA 30093; 404/923-6666*

CIRCLE 315 ON READER SERVICE CARD

A 16-MHz, 80386-based, PC/AT-compatible system, designed for the OEM market, has been announced by **Future International, Inc.** The **XA-600** will address up to 16MB of RAM and can move between operating systems such as UNIX and DOS. The XA-600 is available as either a low-profile, four-slot/four-drive desktop version or as an eight-slot/six-drive standing configuration. Both allow memory expansion via daughterboards. Standard features include 4MB of RAM on the system board (expandable to 16MB); 1.2MB diskette drives; 40MB, 60MB, 80MB, and 130MB hard-disk options; and optional tape backup. The available display monitor options include 12-inch monochrome, 15-inch black-and-white, and 14-inch color. Under \$2,500 in OEM quantities. *Future International, Inc., 5820 Stoneridge Mall Road, Suite 100, Pleasanton, CA 94566; 415/847-2064*

CIRCLE 318 ON READER SERVICE CARD

A family of 80286-based microcomputers, **Premium/286**, has been announced by **AST Research, Inc.** All of the models are PC/AT-compatible and come equipped with a 1.2MB diskette drive, a 101-key enhanced keyboard, a combination diskette/hard-disk controller, and a 25-pin, RS-232 asynchronous serial port and parallel printer port. The operating speeds of 6, 8, or 10 MHz are visible in an LED display on the front panel of the CPU and are user selected by a keystroke sequence. With a total of seven slots, the Premium/286 incorporates two special AST FASTslots, which can run without wait states at any of the machine's speeds. These AST FASTslots can be upgraded in the future to accommodate the next generation of microprocessor cards.

The Premium/286 machines accommodate as many as four drives, with three half-height drives accessible from the front panel. Each model is equipped with either 512KB or 1MB of FASTRAM, which can be configured as expanded (including AST enhanced expanded memory), extended, or conventional memory. All models, except one, include a multimode graphics card that supports graphics modes for the Enhanced Graphics Adapter, Color Graphics Adapter, Hercules Graphics Card, and Monochrome Display and Printer Adapter. AST monochrome and enhanced graphics monitors are optional. From \$1,995 to \$3,995.

*AST Research, Inc., 2121 Alton Avenue, Irvine, CA 92714-4992; 714/863-1333*

CIRCLE 312 ON READER SERVICE CARD

**All Aboard 286**, the latest surface-mount-technology board from **IDEAsociates, Inc.**, can address the maximum 16MB memory of the PC/XT-286 and PC/AT through the use of 1MB RAM chips; it fits them onto one board using single in-line memory modules (SIMM). These space-saving chip packs are mounted vertically to the board's sur-

face. Also included are serial and parallel ports and EGA, CGA, and monochrome capabilities. The board may be configured with up to 4MB of memory using conventional 256KB chips. This memory may be used as conventional, expanded, or extended memory. 128KB, \$995; 4MB, \$2,595; 16MB, \$12,995.

*IDEAssociates, Inc., 29 Dunham Road, Billerica, MA 01821; 617/663-6878*

CIRCLE 316 ON READER SERVICE CARD

Designed to meet the size specifications of the PC/XT-286, **TurboRAM** by **CSS Laboratories, Inc.** is a 16-bit memory expansion card that can be upgraded to 2MB. TurboRAM supports a clock speed of up to 10 MHz. The expanded memory function is provided by the TurboRAM software. 0KB, \$230.

*CSS Laboratories, Inc., 2134 S. Ritchey Street, Santa Ana, CA 92706; 714/540-4141*

CIRCLE 321 ON READER SERVICE CARD

**Asher Technologies** has started shipping a minicomputer gateway. Consisting of a plug-in PC card and software, the **MiniLink Gateway** is based on the 16/32-bit Motorola 68000 processor. Compatible with standard NETBIOS software, the MiniLink Gateway is capable of distributing seven IBM System/3x sessions concurrently to PC users linked together via a LAN. \$2,290.

*Asher Technologies, 1009 Mansell Road, Suite 1, Roswell, GA 30076; 800/334-9339; in Georgia, 404/993-4590*

CIRCLE 322 ON READER SERVICE CARD

**Data Crossing Corporation** has announced an internal 1200-bps modem for the PC Convertible called the **LapTalk 1200C**. This modem offers full Hayes compatibility and a surge suppressor. The LapTalk 1200C consists of two boards: one modem board slides into a guide slot above the battery, another—the direct access arrangement—

DART, Newer Technology's internal memory system

is bolted next to it at the left rear of the unit. The surge suppressor, called **Shock Lock**, consists of an ordinary telephone cord with a pill-box bulge that houses the suppressor itself and attaches to the modem with RJ-11 clips. LapTalk, \$435.00; Shock Lock, \$49.95. Data Crossing Corporation, 1405 Stevenson Drive, Suite 3-803, Springfield, IL 62703; 800/654-1390

CIRCLE 319 ON READER SERVICE CARD

**Newer Technology** has introduced an internal, solid-state memory system for 8088-, 80286-, and 80386-based computers. **DART**, which is installed in a disk drive slot, provides either ultra-high capacity RAM expansion or high-speed mass storage. DART uses a modular, high-density semiconductor array to expand memory in increments of 8MB or 32MB within a single internal unit. Models range in capacity from 8MB to 192MB in 5¼-inch half- and full-height versions. Designed for low power consumption, DART eliminates the need for an internal cooling fan. Controllers are available in PC BUS-based (one slot add-in board) and small computer system interface (SCSI) bus (resides in DART) interface. Parity error correction is standard on all controllers. A transfer rate of 20MB per second is possible, limited principally by host bus bandwidth. 8MB module, \$2,795; additional 8MB modules, \$1,995 each. Newer Technology, 251 Whittier, Wichita, KS 67207; 316/685-4904

CIRCLE 329 ON READER SERVICE CARD

**CMS** has announced **new versions** of its add-on tape drives for the PC/XT-286 and Compaq 386. Available in 20MB and 60MB capacities, the drives are updates to the **Model T-120** and **Model T-160** external tape backup subsystems from CMS. Both drives use one-quarter-inch tape cartridges, adhere to the QIC data format, and feature a transfer rate of 90KB and a tape speed of 90 inches per

second. The T-120 has four tracks, the T-160 has nine. The newer models come with a controller and menu-driven software. Each is housed in a compact cabinet with built-in power supply. T-120, \$995; T-160, \$1,595. CMS, 3080-A Airway Avenue, Costa Mesa, CA 92626; 714/549-9111

CIRCLE 324 ON READER SERVICE CARD

**MicroWay, Inc.** has announced an accelerator board that increases standard PC performance by a factor of 3.5. The **Number Smasher/ECM** can run at board speeds of 4.77, 9.54, or 12 MHz. Number Smasher/ECM comes with matched, factory-installed 8086 and 8087 processors and the 8087 test program. It is available with 512KB or 640KB of

Number Smasher/ECM accelerator board by MicroWay, Inc.

conventional memory with 1MB of extended memory. \$599 to \$1,199.

The **287TurboPLUS**, MicroWay's PC/AT accelerator board, generates an adjustable clock signal to boost the system clock of the AT, which increases the speed from 6 or 8 MHz up to 11.5 MHz in .5-MHz increments. The board plugs into the AT's 80287 socket and includes a hardware reset button. 10-MHz, \$549; 12-MHz, \$629; without 80287, \$149; optional 10-MHz 80286, \$175.

MicroWay, Inc., P.O. Box 79, Kingston, MA 02364; 617/746-7341

CIRCLE 327 ON READER SERVICE CARD

**Atron** has produced a lower-cost, hardware-assisted debugger that plugs directly into the PC or PC/AT. The **MINI-**

MINIPROBE hardware-assisted debugger from Atron

**PROBE** has one realtime hardware breakpoint on reading or writing to memory, or a range of memory or I/O. MINIPROBE has a stop/reset switch box that lets the programmer regain control of the computer when it locks up. Support for Microsoft's CodeView and Atron's other debuggers is included. \$395.

Atron, 20665 Fourth Street, Saratoga, CA 95070; 408/741-5900

CIRCLE 317 ON READER SERVICE CARD

A plug-in card for the PC, PC/XT, and PC/AT that provides realtime in-circuit emulation of a ROM or EPROM of up to 64KB, with an average access time of 200 nanoseconds, is available from **Beck-Tech, Inc.** ROMICE is processor-independent and operates in 4-, 8-, 16-, or 32-bit microprocessor systems. DOS software is included to support a screen editor of the memory contents, hexadecimal file load and save, and 20 other utility commands. \$595.

Beck-Tech, Inc., P.O. Box 5027, Berkeley, CA 94705-0027; 415/548-4054

CIRCLE 326 ON READER SERVICE CARD

A 9600-bps modem for use on voice-grade, dial-up telephone circuits has been announced by **USRobotics, Inc.** The **Courier HST** (for high speed technology) provides full-duplex data communication through an asymmetrical frequency division of the telephone channel. At 9600 bps, the Courier HST uses 32-state Trellis Coded Modulation. A proprietary error-control and flow-control protocol allows error-free transmission of up to 1,100 characters per second. The Courier HST uses an extended version of the Hayes AT command set and works with most data communications software. The modem automatically falls back to 2400, 1200, and 300 bps in both answering and originating calls. \$995.

USRobotics, Inc., 8100 N. McCormick Blvd., Skokie, IL 60076; 312/982-5010

CIRCLE 328 ON READER SERVICE CARD

Dear Reader:

*Imagine an integrated programmer's workstation running on a 386 with all the speed and memory you could ever dream of.*

*Think of what you could do with an integrated editor and an incremental compiler and linker that let you write and modify your programs with blazing speed. And an integrated debugger that maximizes your creativity by working with your language of choice, whether it's C, BASIC or perhaps some new language.*

*Imagine what would be possible if you could run programs through an optimizing compiler that produced small, tight code by performing optimizations throughout your procedures and beyond.*

*These visions from the future are behind the work we're doing today with Microsoft languages. You're already seeing the first steps toward these goals in several of our recent language products, such as Microsoft® C Compiler, Version 4.0, with the CodeView™ debugger, and Microsoft QuickBASIC*

*Compiler, Version 2.0, with its integrated programming environment.*

*You'll continue to see us take more steps toward these visions over the years ahead. Creating the latest technology tools is essential to us at Microsoft, since we use these programming languages every day in our own development work.*

*A year ago we started the Microsoft Languages Newsletter to communicate these advances to you. But we hope we've been able to do a whole lot more by giving you programming tips on topics of interest to you. For example, we talked about mixed memory model dynamic allocation in the Microsoft C Compiler and using the mouse in Microsoft QuickBASIC programs.*

*Send in your suggestions on topics you'd like us to cover in future newsletters. And we'd also like to hear your vision of the ideal programming environment.*

*Establishing this two-way communication with you is important to us. Because hearing what you want is one of the key ways we make decisions that improve our language products.*

*Thanks for sharing your ideas with us about our languages and our newsletter.*

Sincerely,

*Bill Gates*

Bill Gates  
Chairman of the Board  
Microsoft Corporation

P.S. If you'd like to receive a complete set of newsletters from our first year, we'll be happy to send you one while supplies last. Just write us at:  
Microsoft Languages Newsletter, Dept. TJ, 16011 NE 36th Way, Box 97017, Redmond, WA 98073-9717

Screen from Dynaperspective by Sun Grade, Inc.

Business Basic Extended (BB\*) from BASIS, Inc.

## SOFTWARE

**Dynaware**, a division of **Sun Grade, Inc.**, has introduced **Dynaperspective**, a three-dimensional, solid-modeling graphics package. Dynaperspective combines line, shape, form, color, and shade to create complex renderings in two- and three-dimensional formats. The program is based on solid-surface modeling using hidden-surface functions, rather than wire-frame modeling. Thus, the user can perform quick perspective changes, apply surface color and shading, and create curved-surface models automatically either by defining axis points for 360-degree rotation or by freehand. Dynaperspective allows the user to present a rendering with fully-colored solid surfaces, transparent surfaces, or as simple line drawing. Renderings can be viewed from any perspective in seconds, once the initial compilation has taken place. \$1,850.

*Dynaware Division, Sun Grade, Inc., 1309 114th SE, Bellefield Building, Suite 316, Bellevue, WA 98004; 206/451-0200*

CIRCLE 331 ON READER SERVICE CARD

**Data Interface Systems Corporation** has announced a software product that provides IBM 3270 cluster capabilities to workstations in a Novell LAN. Using the **DI3270 Micro/Mainframe Integration System**, a single PC serves as a gateway to an IBM mainframe host, emulating a 3274 controller and serving the communications needs of other PC workstations in the network. The gateway PC remains available for use as a workstation. Each DI3270 workstation on a network supports up to four concurrent IBM mainframe host sessions. Each PC session emulates devices of the 3270 family of terminals. Printer sessions are 3287-emulating print spoolers. A single workstation may have concurrent active sessions at one or more gate-

ways. A hot-key combination lets the user toggle in and out of DOS while host sessions continue to operate. LAN: level 1 (1 to 16 LUs), \$1,295; level 2 (1 to 32 LUs), \$2,495; level 3 (1 to 254 LUs SNA/SDLC only), \$3,695. Single PC: 1 copy, \$475; 2 to 8 copies, \$425 each; 9 copies and up, \$375 each.

*Data Interface Systems Corporation, 827 Harris Avenue, P.O. Box 4189, Austin, TX 78765; 800/351-4244; in Texas, 512/346-5641*

**Ryan-McFarland Corporation** has announced beta testing of XENIX V/386 versions of its **RM/FORTRAN** and **RM/COBOL-85** compilers, which take advantage of the powerful instruction set and large address space of the 80386. RM/FORTRAN includes mainframe extensions from VAX, VS, and FORTRAN-66, and supports virtually unlimited program and array size; it performs both local and global optimizations to produce efficient 80386 object code for high-speed execution. RM/COBOL applications can be moved virtually unchanged to the 80386 from more than 250 environments that it currently supports. These two compilers should become available in late 1987.

*Ryan-McFarland Corporation, 609 Deep Valley Drive, Rolling Hills Estates, CA 90274; 213/541-4828*

A multifunction, hard-disk management program, entitled **Pdisk**, has been released by **Phoenix Technologies, Ltd.** Comprised of 10 utilities, Pdisk features facilities for advanced backup and restore, head parking, memory cache, and DOS simplification. \$195. *Phoenix Technologies, Ltd., 320 Norwood Park S, Norwood, MA 02062; 617/769-7020*

CIRCLE 336 ON READER SERVICE CARD

**Rational Systems, Inc.** has released **Instant-C 2.0**, an incremental compiler for the C language that processes only those parts of the program that the user changes, rather than all of the source code files. Instant-C combines the interactive environment of an interpreter with the speed of a compiler. The new release supports programs up to 640KB in size. Version 2.0 incorporates a full-screen editor, source-level debugger, object-code linker, source-code checker,

# JLASER PLUS

COMBINES SCANNING AND PRINTING IN A SINGLE BOARD!

## It makes desktop publishing a piece of cake!

Tall Tree Systems introduces another breakthrough in desktop publishing with JLASER PLUS. We've combined a 2 MB EMS memory board and an interface to both a Canon®-based laser printer and scanner. JLASER PLUS increases the performance of both devices and gives you a low-cost solution to the limitations you've been experiencing with them.

Furthermore, the same memory that is made available to your printer and scanner is also available for all your other conventional applications. You get system memory, expanded LIM memory, extended memory in an AT-type machine, RAM Disk and print spooler — all in a single slot!

Supporting JLASER PLUS is a host of software packages, such as PC Paintbrush +

from ZSoft, Dr. Halo D.P.E. from Media Cybernetics, LaserGL from Software Express, Ventura Publisher from Xerox, Page Builder from White Sciences, Le Print from Le Baugh Software, Fancy Font and Fancy Word from SoftCraft, Inc., and

many more to be announced. It takes a technological innovator like

Tall Tree Systems to provide a major advancement like JLASER PLUS. And we don't stop at performance. We also deliver value, which is truly icing on the cake.

**TALL TREE SYSTEMS**

## TALL TREE SYSTEMS. A Technological Innovator. Always a Step Ahead!

For true industry leadership, look no further than Tall Tree Systems.

We have a history of being first.

We were the first to introduce bankswitching. The first with two megabyte memory boards. The first with I/O modularity in a single slot. The first with 8 MHz speed capabilities. The only maker of single

command EMS boards. The first with a laser printer solution — JLASER — that allows you to do full-page graphics and multiple type fonts on any Canon® or Ricoh® laser engine.

Now, we're first again with memory expansion for the IBM® RT.

Innovation is our tradition. Our trademark is superior technology at the lowest possible price.

Lifeboat Associates' ADVANTAGE C++ development tool

RapidFile screen, from Ashton-Tate

**Lifeboat Associates, Inc.** has introduced **ADVANTAGE C++**, a development tool that gives microcomputer programmers access to the AT&T's Bell Labs C++ language. ADVANTAGE C++ thus makes it easier to write code that is reliable, reusable, and portable. C++ enables programmers to design their own data types. The user-designed data types actually change the way programs handle data by raising the level of abstraction procedures. Versions of ADVANTAGE C++ are available for use with Lattice C and Microsoft C. \$495.

*Lifeboat Associates, Inc., 55 S. Broadway, Tarrytown, NY 10591; 914/332-1875*

CIRCLE 342 ON READER SERVICE CARD

**Ashton-Tate** has released a **Developer's Toolkit for Framework II**. The toolkit is a collection of routines and programs designed to help developers write faster, more efficient custom applications with Framework II's FRED development language. The software provides tools to create and customize printer drivers, create new import and export file utilities, maintain and use dBASE files from within Framework II, and develop computer-based training materials. \$149.

A file manager called **RapidFile** enables users to manage data, create reports, write form letters, and produce mailing labels. The product uses dBASE III PLUS files, which provides transparent accesses to dBASE data. \$495.

*Ashton-Tate, 20101 Hamilton Avenue, Torrance, CA 90502; 213/329-8000*

CIRCLE 343 ON READER SERVICE CARD

**Lotus Development Corporation** has introduced **Lotus Measure**, a package that collects data from measurement instruments and devices and puts them directly into Lotus 1-2-3. Measure works with 1-2-3 as a single program; it employs the identical user interface and macro environment, and because macros can incorporate both 1-2-3 and

Measure functions, a single macro can automate the entire process of data collection, analysis, graphic display, and storage to disk. It supports IEEE-488 and RS-232 communications and provides compatibility with selected analog-to-digital boards as well as with more than 8,000 instruments and devices. \$495.

*Lotus Development Corporation, 55 Cambridge Parkway, Cambridge, MA 02142; 617/577-8500*

CIRCLE 345 ON READER SERVICE CARD

**NVRD**, a nonvolatile RAM disk from **Fort's Software**, improves performance for many disk-intensive applications. NVRD maintains two copies of its RAM disk; a nonvolatile "backing file" on the hard disk and a working copy, kept in expanded memory. The working copy is temporarily lost whenever the PC boots up, but the backup copy remains valid. When a program writes to a nonvolatile RAM disk, NVRD updates both copies of the data. Performance during writes is comparable to a hard disk. On systems configured with NVRD, **V-EMM** (Fort's virtual expanded memory manager) and an expanded memory board, the trio function as a disk-caching program, however, the amount of memory assigned to NVRD varies with the activity of other expanded memory applications. NVRD, \$49.96; V-EMM, \$119.90.

*Fort's Software, P.O. Box 396, Manhattan, KS 66502; 913/537-2897*

CIRCLE 346 ON READER SERVICE CARD

**RTCS/Real-Time Computer Science Corporation** is now shipping **RTX286**, a realtime, multitasking, multiuser operating system for the PC/AT. RTX286 is a complete implementation of Intel's iRMX286 operating system. It takes advantage of the protected mode of the iAPX286 processor by offering memory access protection, as well as allowing users to directly access as much as 16MB. **RTX286-C** is a version that can be configured for users who must add special

device drivers. RTX286-C consists of object libraries for RTX286 device drivers and an OEM license agreement permitting duplication and distribution of the final configuration software on a nominal, per-copy fee. RTX286, \$2,395; RTX286-C, \$2,795.

*RTCS/Real-Time Computer Science Corporation, 1390 Flynn Road, Camarillo, CA 93010; 805/987-9781*

Over 5 Years.  
More Than 2,000,000 Times.  
AST Has Increased  
The Power Of The PC.  
Now, Out Of This Experience  
Emerges A Powerful And  
Versatile Personal Computer.  
Built On Proven Technology.  
Enhanced Like No Other.

Announcing  
AST Premium/286.™

# Discover AST Premium/286. The First AST Quality, Uncompromising AT<sup>®</sup> C

## **More than two million people have made us the first choice in PC Enhancement.**

For over five years, you've known AST as the leading PC enhancement company. Now, we're introducing the ultimate enhancement: AST Premium/286. The first AT-compatible personal computer with AST performance and reliability. More flexible and upgradeable. Skillfully combining lightning fast processing speed and uncompromising compatibility.

**AST FASTslots<sup>™</sup>: Processing speedways.** Forming the foundation of the AST Premium/286's increased speed are our FASTslots. This advanced architecture improves overall performance so there's enough built-in power to satisfy even the most demanding user.

The AST Premium/286 operates 50% faster than an 8MHz PC AT<sup>®</sup> as measured by the Norton Utilities<sup>™</sup> Version 3.0 SysInfo. And maintains full compatibility with standard PC and AT-based enhancement cards. It also provides for a powerful, easily upgradeable and expandable future, accommodating the next generation of accelerator and high-performance enhancement cards.

## **A Heritage Of Software Compatibility.**

Software compatibility has always been one of our strong points. Shipped with the industry-standard MS-DOS<sup>®</sup> 3.1, AST Premium/286 is compatible with widely accepted operating systems such as IBM<sup>®</sup> PC-DOS<sup>™</sup>, Concurrent DOS<sup>™</sup> and XENIX<sup>™</sup>. It's also designed to get the most out of multitasking software packages like Microsoft<sup>®</sup> Windows, DESQview<sup>™</sup> and TopView<sup>™</sup>.

**Applications-oriented.** Keyboard-selectable operation at 10, 8 or 6MHz means virtually all popular off-the-shelf IBM PC and PC AT application software is immediately compatible. All your favorites, including Microsoft Word, Lotus<sup>®</sup> 1-2-3<sup>®</sup>, Framework<sup>™</sup>, Symphony<sup>®</sup>, dBASE<sup>®</sup> III and AutoCAD<sup>™</sup>.

## **Attain your fullest software potential.**

AST's advanced architecture also provides faster and more flexible memory addressing. While built-in Enhanced expanded memory capabilities—AST FASTRAM<sup>™</sup> expandable to 2MB in a single slot—let you break the 640K DOS barrier. Create bigger spreadsheets and sort larger databases. And enjoy the uninterrupted workflow benefits of multitasking using current DOS versions, with full support for protected mode software built-in.

**Fast access disk storage.** Complementing AST Premium/286's speedy operation is a full line of disk systems. There's a 20MB, 40MB and a 70MB hard disk. Both the 40MB and the 70MB offer more storage and faster access times—below 30msec—than the PC AT's fixed disk. And our external disk/tape systems, featuring advanced SCSI architecture, allow easy expandability.

**Prices Start  
At \$1995.00\***

# Personal Computer With Legendary Compatibility and Lightning Speed.

**More standards are standard.** We build-in our AST FASTRAM™ memory card. And most models include our own multi-mode enhanced graphics adapter, supporting IBM EGA, CGA and Monochrome, and Hercules Graphics Card™ display modes.

**Compatible with AST and IBM Products.** AST Premium/286 is designed to remain your productivity partner for years to come. Choose it with confidence for single and multitasking applications, individual and shared environments alike. Use it as an engine with other AST products to form powerful application workstations for desktop publishing, CAD/CAE and more. Or to increase connectivity use it as a network file server, to communicate with IBM mainframes and minicomputers, or to manage multiuser environments.

**Solutions that are ready to go.** We also offer a number of pre-configured workstation solutions tailored for maxi-

mum performance in your application. Combining our proven products, from local area networking and data communications to extra memory and I/O to laser printers and disk systems, our solutions are all designed to increase your business productivity.

**Quality across the board, around the world.** When you buy AST products, you're also purchasing a worldwide reputation for service, support and product dependability. AST Premium/286 is backed by a one year limited warranty, and our worldwide network of certified dealers and service centers.

**AST Premium/286 - The system and the solutions.** For more information call our Product Information Center at (714) 863-0181 or send the coupon to: AST Research, Inc., 2121 Alton Avenue, Irvine, CA 92714-4992.

Seven industry-standard expansion slots; 1 PC-compatible slot, 6 PC AT-compatible slots, including two AST FASTslots. FASTslots provide no wait state operation with a high-speed direct interface to the 10MHz 80286 processor. Advanced architecture accommodates the next generation of accelerator and high-performance enhancement cards. It's also an open architecture for easy development and system integration.

Based on industry-standard native 80286 technology, complemented by AST advanced architecture.

Coprocessor socket accepts 8MHz 80287 devices to execute math- and floating point-intensive programs faster.

Two AT-compatible expansion slots with a plus: a third bus connector featuring lightning-quick CPU access time, for use with specially-designed cards like the AST FASTRAM Enhanced memory card. Expandable to 2MB in single slot, FASTRAM supports a variety of addressing capabilities—Enhanced EMS, EMS, extended (protected mode) and conventional memory addressing.

Enhanced, low-profile 101/102-key keyboard with separate numeric keypad, dedicated cursor control and extra function keys. International versions available.

AST Premium/286 is shipped with MS-DOS and GW BASIC® and it's fully compatible with a wide variety of operating systems, operating environment and utility packages, and application software.

Indicators let you check your clock-speed—user-selectable at 10, 8 or 6MHz. Reset button allows easy cold-booting. Security lock prevents unauthorized keyboard access.

**"The Perfect 10"**

10MHz, 0 wait-state operation, faster than the 8MHz PC AT, with IBM PC AT hardware and software compatibility.

Supports standard PC, PC AT and AST FASTslot cards. With AST, you start with a lot, like our included FASTRAM Enhanced memory card and multimode Enhanced Graphics Adapter, but you've also got a lot of options. We offer the widest range of compatible enhancement products and peripherals to suit your needs—a true one-stop solution allowing you to expand and upgrade your system with the assurance of future service and support.

Compare the increased speed of the AST Premium/286 against the top competitors for yourself. (Basis: Norton Utilities Sysinfo Version 3.0)

## The Most Powerful LAN Fits on a Disk.

Network Power. You knew that someday there would be a powerful LAN that didn't need old-technology network boards. It would be fast, easy to install, and run 99% of PC-DOS software. It would be expandable, provide remote access, password-protection, and enable you to use inexpensive terminals as workstations in a PC-DOS environment.

Dream no more, because the power is here.

Its name is LANLink™

**A Software-Driven LAN Powerful Enough To Use RS-232 Ports for Network Communications.** In development for over three years, LANLink™ represents the next generation of local area networks. All of the logic which has traditionally resided on network boards is on LANLink's Satellite and Server Diskettes.

No additional hardware is required. Inexpensive serial ports replace "Kilobuck" Network Interface Boards making installation costs one-third that of a board-driven network.

**How To Configure a Smart Network...With Dumb Terminals, But Without Dedicated Servers.** Boasting a wide variety of configurations, LANLink™ is most often set up as a "Star" having up to eight satellites connected to a central, nondedicated server. Larger networks can have multiple servers, supporting a total of 73 or more network users.

R-LAN™ (Remote-LAN) gives users the ability to interact with a LANLink™ network in real time via modem. Plus, if MultiLink Advanced™ is run on a Satellite, inexpensive dumb terminals can be used to access network disks, files, and programs.

**99% of PC-DOS Applications Run in a Totally-Transparent Network Environment.** If you know DOS, you already know how to use LANLink™ COPY transfers files among users, and a 2-drive PC Satellite boots 1-2-3 from the Server's hard disk with the entry c:\lotus. Each satellite's access can be limited to specific disks, printers, and sub-directories. A wide variety of software including Lotus 1-2-3, dBASE III, and WordStar 2000 is fully compatible. LANLink™ has a collision-free data transfer rate which exceeds 115,000 BPS.

**Power Up Your PCs Today.** For complete details and the authorized dealer nearest you, call The Software Link TODAY. The LANLink™ Starter Kit is \$495 and includes modules for both a Server and a Satellite. For a limited time, 50 feet of shielded RS-232 cable will be included free of charge. Additional Satellite Modules are only \$195, each.

LANLink™ is immediately available and comes with a money-back guarantee. VISA, MC, AMEX accepted.

THE SOFTWARE LINK, INC./CANADA 250 Cochrane Drive, Suite 12

CIRCLE NO. 196 ON READER SERVICE CARD

4 REASONS TO CHOOSE  
PROGRAMMER'S CONNECTION:

# QUALITY SUPPORT PRICE & INTEGRITY

As we enter 1987, we'd like to extend a warm thank you to our customers and wish everyone a Happy New Year!

If you've bought from us before, we look forward to serving you again. And if you're not yet familiar with our one-stop service, we invite you to give us a call.

It's our commitment to quality, support, low prices and integrity that makes us your best source for the programming tools you need. So make the connection today and discover the value and convenience of our one-stop service for yourself. You'll be glad you did!

**We** carry the finest selection of the best programmer's development tools specifically for IBM Personal Computers and compatibles. They are the latest versions and most come with 30-day documentation evaluation periods or 30-day return guarantees.

**We** firmly believe that high quality must be present throughout every aspect of our service. So to make sure that we maintain such high standards, we include a service questionnaire with every purchase. We're very interested in what our customers have to say.

**Our** courteous, knowledgeable, non-commissioned salespeople are always ready to assist you. We also have experienced technical consultants on staff who can answer questions about products and provide sound, unbiased advice. We'll support you before and after you make your purchase. Your satisfaction is very important to us.

**Our** buying power enables us to offer you the lowest prices without sacrificing service.

**UPS** shipping is FREE to all U.S. customers. There are no extra charges for credit cards, CODs, purchase orders or special handling (except for export preparation).

**Quite** simply, the discount prices listed with the products on the next two pages are all you pay. There are no hidden add-on charges.

**When** we started Programmer's Connection in 1984, we dedicated ourselves to providing high quality personal service to every customer. Since then, we've quickly grown to be the leading independent dealer in this industry.

**We're** very proud of the trust we've earned from our customers and we pledge always to be worthy of it.

## LOWEST PRICES

Since this ad is prepared in advance of publication, some of our current prices may be lower than what's advertised here. Call for latest pricing.

## FREE SHIPPING

Orders within the USA (including Alaska & Hawaii) are shipped FREE via UPS. Express shipping is available at the shipping carrier's standard rate with no rush fees or handling charges. To avoid delays when ordering by mail, please call first to determine the exact cost of express shipping.

## CREDIT CARDS

VISA and MasterCard are accepted at no extra cost. Your card is charged when your order is shipped. Mail orders please include credit card expiration date and telephone number.

## CODs AND POs

CODs and Purchase Orders are accepted at no extra cost. POs with net 30-day terms are available to qualified US accounts only.

## FOREIGN ORDERS

Shipping charges for foreign and Canadian orders are based on the shipping carrier's standard rate. Since rates vary between carriers, please call or write for the exact cost. Foreign orders (except Canada), please include an additional \$10 for customs form preparation. All payments must be made with US funds drawn on a US bank. Please include your telephone number when ordering by mail. Due to government regulations, we cannot ship to all countries.

## VOLUME ORDERS

Call for special pricing.

## SOUND ADVICE

Our knowledgeable technical staff can assist in comparing products, answer technical questions and send you detailed product information tailored to your needs.

## 30-DAY GUARANTEE

Most of our products come with a 30-day documentation evaluation period or 30-day return guarantee. Please note that some manufacturers restrict us from offering guarantees on their products. Call for more information.

## Flexible SCREEN and WINDOW Development with

### ZVIEW Screen Library

Use this field-sensitive tool to develop data entry screens and windows and provide run-time flexibility. Security level settings restrict inquiry or update of fields; multiple screen help display is available at screen and field level.

**NEW Features:** Windows can be stacked, peeled off, and moved at run-time. You also get automatic scrolling of data within fields.

ZVIEW gives you full control of attributes, colors, boxes, protected fields, scrolling, and more. Load screens from memory for SPEED. Field support includes alpha, numeric, or alphanumeric data types, case conversion, range checking, and field comparison. ZVIEW even provides automatic data conversion to and from ASCII screen format. Microsoft C, Lattice 3.0, and Aztec 3.2e. Supports EGA, color, and monochrome displays.

**PCDOS \$189**

## C DYNAMO! WINDOWING: Full C Source, No Royalties POWER WINDOWS And C FUNCTION LIBRARY

Power Windows covers all the bases: overlays, borders, 1-2-3 style or pop-up menus/help windows, zap instantly on/off screen, status lines, horizontal/vertical scrolling, color control or highlighting, word-wrap, files to windows, keyboard to windows. Powerful, easy to use, integrated error messages, thorough documentation. Supports IBM monochrome or color.

**MSDOS Only \$119**

C Function Library - includes 325 fundamental functions with readable source and thorough documentation.

**MSDOS Only \$119**

No matter what you have, you need these. Best value available. Highly recommended!

**Entelekon**

## BRIEF Makes Editing C Programs a Breeze

BRIEF, The Programmer's Editor, is tailored for C programmers. Take a look at the BUILT-IN features below — just part of the reason why 1000's of C programmers already rely on BRIEF.

**AutoCompile** - While in BRIEF, with MS C, Lattice, other compilers

**AutoIndent** - Use default or modify

**Template editing** - for "fill in the blanks" style programming

**Error to Error Tracking** - "Next error" moves to right line

**MultiWindow Editing** - Any size, any number

**Macro Language** - Completely readable, programmable

BRIEF can be used with *any* language. *Even beginning programmers* become productive in less than 30 minutes. Ask about UNDO (not undelete), Unlimited File Size, Tiled & Pop-Up Windows, or for a detailed product description.

**Solution  
Systems**

**PCDOS \$195**

## NEW Blaise Tools Are Better Than Ever C Tools Plus

Free yourself for more creative programming; stop worrying about hardware dependence. Handle everything from co-resident software requirements to multiple display pages and monitors with C Tools Plus. Filter interrupts so that other resident programs still work. 200+ well-documented functions control screen handling (direct to video adapter or BIOS calls, EGA text mode support including 43 line and multiple display pages — even handle multiple monitors), an unlimited number of pop-up, stackable windows with word-wrap, interrupt service routines, DOS directory and file handling, memory management and program control, string functions, and more. Source, no royalties. Lattice 3.0, MS C.

**BLAISE COMPUTING INC.**

**PCDOS \$149**

## Compiler-Compatible Interpreter, Editor, Debugger Interactive-C™

A fully integrated development environment, Interactive-C combines a K&R standard interpreter with a full-screen editor and source-level debugger. **Interactive C is 100% compatible with Lattice or Microsoft.** You can link in external libraries — your own or commercial: no source code modifications are necessary!

The full screen editor gives you adjustable edit, command, and status windows. Switch to second screen for output, or even display on two separate monitors.

Why get only a limited debugger when you can get full source debugging with an interactive interpreter? Unlimited breakpoints, variety of stepping modes, interactive viewing and modification of variables, automatic positioning of cursor at error. Even stop to edit, then continue without re-executing from start. 8087/287 support.

Specify Lattice or Microsoft.

**PCDOS \$219**

## Fast Prototyping and Development of User Interfaces with Skylights

*"It's much easier to adapt to the end-user's needs than any other product I've seen . . . definitely a programmer's tool."*

William Elswick, Software Engineer, Compact Video

Quickly design interactive prototypes, then include screens you develop in your finished application code. Design demos or tutorials.

Skylight combines an intuitive screen/window/menu editor, run-time windowing, menu handling, and front-end support routines, and "Demo/Tutorial Maker" program plus detailed low-level primitives. Supports a variety of pointing devices (mice, tablets, lightpens). All major C compilers; even use with other languages (BASIC, Pascal, Assembly) with utility included. Bit-mapped graphics upgrade available. No royalties.

**Skylight PCDOS \$359  
Software, Inc.**

## A NEW C Standard for SCREENS and WINDOWS: C-SCAPE

Setting a new standard for screen generation, C-scape turns your Dan Bricklin Demo Program screens into C code instantly. You can capture existing screens from 1-2-3, Turbo, or that old BASIC diehard and convert them to C in seconds. C-scape can save you immense effort and reduce errors for both new program development and language conversion projects.

C-scape is a combination screen generator and library of input/output functions that provides an advanced and powerful ability to create different types of menus, input fields, help screens, and text with unprecedented speed and flexibility. Tiled, pull-down, and pop-up windows of virtually any depth (limited by RAM) are a key feature, along with scrolling, full color and type support, and individual key or field validation.

Because C-scape is based on C's printf statement, you can embed the commands for screen positioning and field definition right inside your format string. This helps you produce clear, readable code, which is easier to maintain and change.

Since full source code is provided, the standard library routines can be tailored to meet your exact screen layout and keystroke handling requirements.

All C programmers will benefit from C-scape's readable, intuitive syntax, based on an extension of C's printf function. Beginners will learn by studying code generated from captured screens. Advanced programmers will enjoy C-scape's ease of maintenance. Power programmers will appreciate the free source code provided at no additional cost upon registration.

Oakland Group, Inc. features free updates, an on-line bulletin board for users, and toll-free technical support at 800-233-3733 (800-BEE-FREE) or 617-491-7311.

Escape the pitfalls of coding from scratch, and free up your time for creativity and productivity. Buy C-scape now and take advantage of the 31-day review period: satisfaction guaranteed or your money back. No royalties. No license fee. Lattice 3.0, Microsoft 3.0 & 4.0.

# The Root of the Problem

*A modern equivalent of a time-honored technique cuts the time needed to calculate square roots in interpreted BASIC.*

Building an intricate graphics program requires evaluation of thousands of square roots, but only to integer accuracy. BASIC compilers do it the hard way: they convert the integer function argument to a single-precision, floating-point number, take the square root of that, then convert the floating-point result back into an integer.

The assembly language subroutine in ROOT.ASM (listing 1) produces the nearest integer to the actual square root of an integer argument. It returns a zero value for a negative argument rather than an error. Because the routine has no absolute jumps, it could be used to speed up interpreted BASIC if it were coded into an integer array. ROOT also can be BLOADED into an interpreted basic program.

## LISTING 1: ROOT.ASM

```
*****
;                               ROOT.ASM                               *
; ROOT() is an assembled fast integer square root subroutine to be *
; linked to Microsoft compiled BASIC programs.                      *
; Call with ROOT(x,y) where x is an integer expression              *
; y is an integer variable                                           *
; The square root of x will be returned in y. (Negative input will *
; return a zero.)                                                    *
;                                                                       *
; ROOT is a binary adaptation of the synthetic division square root *
; procedure shown in the paper by J. E. Meggit, "Pseudo Division and *
; Pseudo Multiplication Processes." The IBM Journal of Research and *
; Development, vol. 6, no. 2 (April 1962). pp. 210-226.             *
;                                                                       *
; Written by M. L. Lesser, April 13, 1986                             *

```

ROOT uses a modern equivalent of the old "subtract successive odd numbers" technique that was popular during World War II. (John Meggit generalized this technique in his 1962 paper, cited in listing 1; it since has replaced iterative procedures for calculating square roots, logarithms, and inverse trigonometric functions in pocket calculators and well-designed compiler libraries.)

An example of ROOT in use under Microsoft's Quick-BASIC is given in ROOTTEST.ASM (listing 2). ROOTTEST runs four times faster using ROOT than it does using Quick-BASIC's floating-point, square-root function.

*Murray Lesser is an author and retired after 26 years at IBM.*

# PCOX The Micro-To-Mainframe Mainframe

Now PCs on your LANs can talk to your mainframe as easily as they talk to each other.

Talk about resource sharing.

All it takes is one PCOX Gateway to deliver full mainframe privileges to all the PCs on a LAN.

And talk about resource *saving*. A PCOX Gateway can save you all kinds of modems, controllers, terminal emulators and line costs.

Each PCOX Gateway is a single board that plugs into a single slot on a single PC on the LAN. And unlike other gateways, PCOX Gateways let every PC on the LAN

talk to the mainframe, using software alone.

In fact, PCs can talk through more than a single PCOX Gateway. They can automatically seek mainframe sessions through multiple PCOX Gateways on a LAN. Then they can carry out 3278/79 emulation, 3270 PC emulation, send-receive file transfers, or even 3287 host printer emulation with their PC printers.

PCOX Gateways work in all NET BIOS-compatible LANs, including IBM's own Token Ring and PC Network, plus LANs from AST, AT&T, Novell, Sytek, Ungermann-Bass and others.

# Gateways: Micro-To-Micro-To- Connections.

PCOX/GATEWAY COAX connects directly to a 3274 cluster controller, and supports up to five concurrent host sessions. In fact, you can even make a PCOX Gateway Coax out of your existing IRMA™ board.

PCOX/GATEWAY-16 and PCOX/GATEWAY-64 each connect to a mainframe communication controller over modems and phone lines, and support up to 16 or 64 host sessions.

You can also put any number of PCOX Gateways on any size LAN, and control access to the mainframe through configuration and

security features built into the gateway itself.

PCOX Gateways are products of PCOX Technology, a modular system of advanced micro-to-mainframe connections that helps manage PC demands for mainframe access.

And PCOX Gateways are at the top of the PCOX product migration path. Which means all you need is software to turn any existing PCOX micro-to-mainframe link—coax or remote—into a PCOX Gateway.

So find out how PCOX Technology can help connect any number of micros to your mainframe. Call

now for more information about PCOX Gateways. And ask for the name of your nearest CXI distributor.

# The Token-Ring Solution

**T**oken-passing is the prevalent means of ring control for local area networks (LANs) in the United States. The popularity of this method is attributable in large part to IBM's long-standing commitment to the token-ring technique. It is also the one ring-access method selected for standardization by the IEEE 802 Local Network Standards Committee, specifically, the 802.5 token-ring standard.

In "Underlying Connections" (J. Scott Haugdahl, December 1986, p. 126), the IBM Cabling System was ex-

amined in its role as support for the IBM PC Token-Ring LAN. This article examines the operation of the Token-Ring and related products. The emphasis is on the actual Token-Ring operation; little attention is given to applications that have carried over from the PC Network, such as NETBIOS and the IBM PC Network Program. (A final article in an upcoming issue will examine the issues involved in running benchmark tests on the Token-Ring network.)

IBM's first public pronouncement of interest in the token-ring came in a

J. SCOTT HAUGDAHL

*The IBM Token-Ring LAN is the long-awaited key to linking PCs in an efficient, powerful arrangement that is finally more productive than troublesome. It boasts a range of present and future connectivity options.*

series of four papers it presented to IEEE 802 in March 1982 and at an International Federation of Information Processing (IFIP) conference in Florence, Italy, in April 1982. The March disclosures described a new architecture; the IFIP presentation dealt with implementations of that architecture. In August 1982, at an IBM users' group meeting, the company presented a fifth paper on wiring. IBM then presented the IEEE 802 papers at the IEEE Computer Society's semiannual conference, COMPCON, in the fall of that year.

The next major development was a public demonstration at Telecom 1983 (in Geneva, Switzerland) of a Token-Ring prototype. In this simplified version, an attached device gained access to the network by changing the status of a perpetually circulating 1-bit token from free to busy. The token is in the header of a message frame, which then is filled with all or part of the message itself. The demonstration ring simply consisted of a wiring concentrator connected to several terminals, including 3270 terminals, 8775 display terminals,

ILLUSTRATION • ANDY LEVINE

## TOKEN-RING

a 3275 front-end processor, and 8100 distributed processors.

In May 1984, IBM announced the IBM Cabling System, a system designed to connect all IBM data communications devices and to accommodate the still-to-come Token-Ring. In October 1985, the official announcement of the IBM PC Token-Ring Network was made, along with a series of other products for the IBM PC family. IBM felt that its 4-Mbps (megabits per second) rate was adequate for departmental/office automation requirements, that the token-passing protocol offered superior throughput under heavy loads (compared with 3Com's EtherNet), and that the protocol was better suited to supporting IBM's synchronous devices.

Concurrent announcements to the Token-Ring included the Multistation Access Unit (MAU), support for telephone wire (type 3), the Asynchronous Communications Server, the IBM PC Token-Ring Adapter, the NETBIOS Emulation Program, enhancements to the 3270 SNA Emulation Program, and APPC/PC (Advanced Program-to-Program Communication for the PC). The IBM PC Local Area Network Program was released with DOS 3.2.

The October announcement generated a lot of criticism in the areas of system sizing and interconnectivity. Only a single ring was supported with a maximum of 260 devices over a limited distance. The only direct connection was an adapter for the PC.

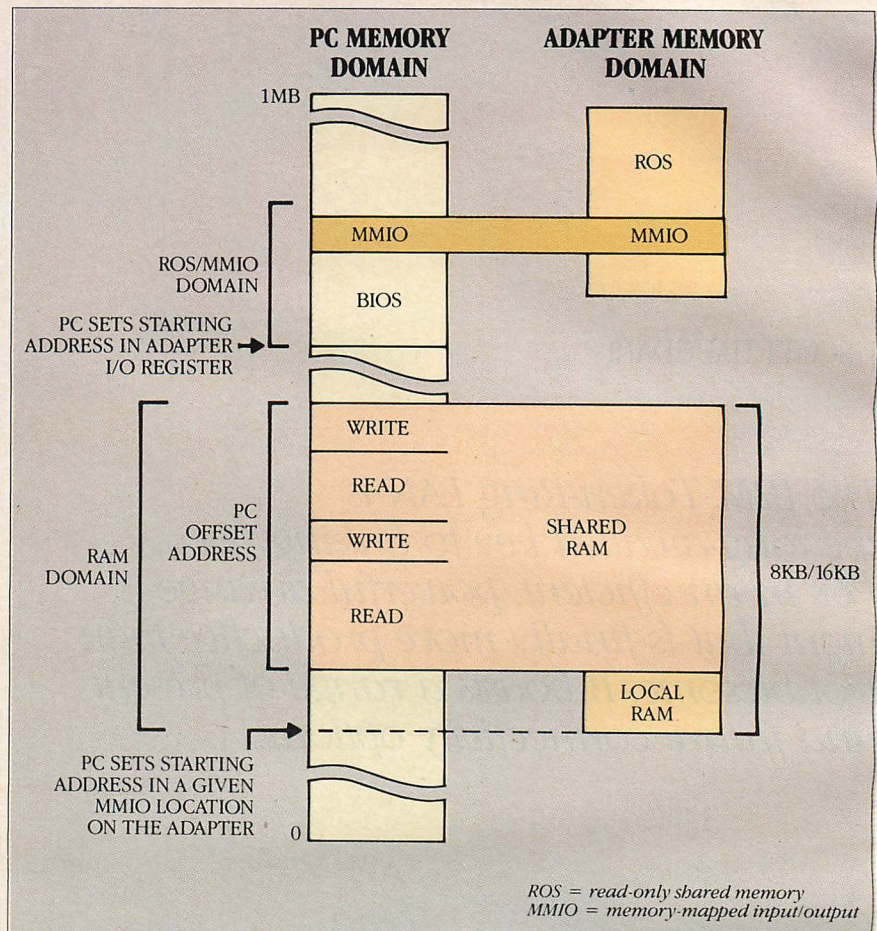

An announcement made in April 1986, however, quieted the critics. True to IBM's claim that the Token-Ring is evolutionary (not revolutionary) in nature, several missing pieces were announced. These included copper and fiber repeaters; the PC Adapter II; a lower-cost, data-grade, type-9 wire; a bridging program for multiple rings; a Network Manager program; and new host attachments for System/36 (via a PC/AT) and System/370 (via a 3725).

Minor announcements in May and June of 1986 added the new 3174 Cluster Controller with a Token-Ring option and a Token-Ring Adapter for the RT PC. In September 1986, IBM announced a Token-Ring starter kit, a new version of NETBIOS to support the 3270-PC and 3270-AT, an upgraded Network Manager Program, and NetView/PC.

### A BETTER ADAPTER

The original IBM Token-Ring Adapter for the PC is a full-size card that works with the PC, PC/XT, PC/AT, 3270-PC, and 3270-AT. In order to maintain compatibility with all models, the Token-Ring

**FIGURE 1: Shared Memory Map**

The shared memory can be accessed as 8-bit-wide memory from the host or as 16-bit-wide memory from the adapter's microprocessor. The host processor can set certain areas of the shared memory to read-only to protect them from corruption.

Adapter does not use the extended 16-bit bus available in the AT. Fortunately, this choice does not affect performance. By using a shared memory interface rather than a DMA (direct memory access) channel, the adapter overcomes the 8-bit DMA deficiency of the AT (in 8-bit mode, it actually operates slower than an XT), and scarce DMA channels are preserved. In their place, a block of reserved memory is used. And, the faster the processor in the PC, the better its performance on the Token-Ring.

The adapter functions as an intelligent communications processor. It contains five custom analog and VLSI (very large scale integration) devices that handle the protocols and interface to the two twisted-pair wires. The nonanalog devices were developed by IBM/Burlington, using a new, high-density, high-speed, bipolar technology. An on-board 16-bit processor aids in initial diagnostics, on-going diagnostics, and communications functions. The processor in the adapter is IBM-proprietary, but it

carries a Motorola symbol, indicating that the adapter is not based on an Intel microprocessor technology.

The microprocessor executes resident microcode (32K-by-16-bit words arranged as two 32K-by-8-bit EPROMs) that provides the host access to logical-link functions according to IEEE 802.2 LLC (logical link control) or physical-link functions according to IEEE 802.5 MAC (media access control). The initial release of the adapter supports the 4-Mbps data rate, as specified by 802.5.

When the PC is booted, built-in diagnostics perform a power-on-self-test (POST) procedure. The POST checks all the internal operations of the adapter, including the on-board timers. The adapter also checks the lobe cabling (up to the MAU and back) with loop-back tests to ensure that the cable is indeed operating properly.

A single chip functions as a front end for the adapter. It is, essentially, an analog device that performs differential Manchester encoding/decoding (ex-

plained below), data synchronization, and physical insertion/removal from the ring. The chip is transformer-coupled in order to isolate the adapter from the cable electrically.

The two-chip protocol handler (one for transmit, one for receive) performs parallel-to-serial conversion, encoding/decoding of data (from the front end), CRC (cyclic redundancy check) generation and checking (removal), DMA to shared memory, monitor function, and detection of ring errors. The protocol handlers operate at speeds as high as 40 Mbps, thus accommodating ring bit rates higher than 4 Mbps.

The shared memory is organized as four banks and eight banks, respectively, of 4K-by-4-bit static RAM on the original Adapter and the Adapter II. It can be accessed as 8-bit-wide memory from the host or as 16-bit-wide memory from the adapter's microprocessor. The shared memory starting address can be programmed by the host, thereby eliminating the need to set switches. Any 8KB/16KB boundary can be programmed and certain areas of the shared memory can be protected from corruption (set to read-only) by the host. Figure 1 shows a rendering of how shared memory might be mapped into the PC memory domain and how certain areas might be protected.

This memory-mapped scheme has caused problems for third-party PC vendors as well as for users. Several IBM technical reference manuals warn that certain areas of memory are "reserved for future use." Some vendors have used these reserved areas in spite of the warning, resulting in their add-on boards not functioning properly with the Token-Ring Adapter installed. However, most vendors (Intel, for example, with its Above Board) have begun to provide corrections to this problem.

Other questions have come up regarding the I/O address space. Originally, IBM used a 10-bit I/O address allocation, but the Token-Ring Adapter decodes 12 bits. This may cause conflicts for boards that are not designed to ignore addresses over 10 bits long. The Digital Communications Associates' IRMA card was one of them, but it has been modified to avert the problem.

Although not immediately apparent, the Token-Ring Adapters have been engineered to accommodate future IBM PCs. In addition to the high-speed protocol processors and a 16-bit microprocessor, IBM chose high-speed static RAMs operating in the sub-65-nanosecond access-time range. This more than satisfies the AT or future PC mem-

ory requirements (such as the PC/XT-286 with its zero-wait states).

In addition to the shared memory interface (also referred to as MMIO, or memory-mapped input/output), certain functions are controlled by the programmable I/O (PIO) interface via a location in the PC's I/O space. The address of this I/O location is set via a DIP switch on the adapter. This I/O port provides access to one of eight 2-byte control registers. These registers control functions that include bidirectional interrupt and status, the PC-shared RAM starting address, the PC-shared RAM management (which takes care of setting protected areas), timer control at the millisecond (ms) level, and the PC timer value register.

The adapter provides interval timers that ensure proper token operation of the ring, and a general-purpose, 10-

***By using a shared memory interface rather than a DMA channel, the adapter is able to overcome the 8-bit DMA deficiency of the AT.***

ms timer accessible by the host PC. It also includes the dead-man timer, a 120-ms timer that checks to see if the adapter code is executing; if this timer expires, a procedure is begun to remove the bad adapter from the ring.

The interface between the adapter and the host is handled by a custom gate array: the attachment interface. This proprietary array was designed by IBM and manufactured by OKI Semiconductor; no complete disclosure of its exact function has been made. Clearly, it handles the contention for shared memory, and most likely it controls the I/O port assignment and the read/write functions to the port registers that probably are located on the chip.

Provision has been made for an 8K-by-8-bit ROM BIOS option (the ROS, or read-only shared memory, in figure 1), although IBM had not released such an option at the time this article was written. When it becomes available, the option likely will allow a PC to be booted remotely from the network without using a local drive.

For attachment to the network, the adapter card provides a standard DB-9-type connection to the PC adapter ca-

ble. Pins 1, 6, 5, and 9 are used to connect to receive +, receive -, transmit -, and transmit +, respectively. The adapter cable, a flexible eight-foot, type-6 strand, connects to data-grade (type 1, 2, or 9) media. An optional type-3 media filter is available for use when type-3 wire is employed.

The adapter comes with a diskette containing the adapter handler (the Token-Ring Extended User Interface, or TOKREUI), the adapter diagnostics program, and a ring diagnostics program for use during operation of the ring.

IBM has released an upgraded technical reference to support the built-in enhancements to the Token-Ring PC Adapter II. According to IBM's official release, the Adapter II appeared simply to add more RAM (8KB), so that it could process more frames of larger size, handle more names and sessions within NETBIOS, and so on. These capabilities were necessary for the bridge program and System/36 interconnect. But a more important improvement was made as well. New commands (those executed by the on-board 16-bit microprocessor) were added to support the System/36 and bridging environments. An important new command allows a host to add more links to a service access point (SAP), as defined by IEEE 802.2, without the previously required connect/disconnect command sequence. This new command improves the performance of a host acting as a server.

## **IBM VERSUS TI CHIP SET**

Although both the IBM and Texas Instruments (TI) chip sets provide a functional IEEE 802.5 interface, several subtle differences are noteworthy between the two implementations.

IBM generally does not offer its chip set to other vendors. In this case, TI and IBM collaborated during the development of the TI chip set, with IBM supplying the functional specification. Currently, TI is the only "third-party" vendor to offer an IEEE 802.2/802.5 chip set (Ungermann-Bass developed a set on its own). The joint IBM/TI agreement was announced in September 1982; the TI chip set was announced on October 15, 1985, the same day as IBM's formal Token-Ring announcement. A system developed with TI's chip set will be fully IEEE 802.5-compatible with IBM-developed Token-Ring adapters. (More than 200 vendors have requested TI chip set evaluation kits.)

Both the TI and IBM sets are essentially five-chip implementations. The TI set as a whole is called the TMS380 LAN Adapter chip set. Roughly speaking, the

# Introducing AST's All-Star LAN Lineup.

Kick off a winning season with AST's all-star solution for networking your IBM® PC/XT/AT and compatibles. The AST Star System™ gives first-time LAN buyers, as well as seasoned players, a reliable, industry-standard (IEEE 802.3) network solution for a minimal cost. Whether you need to link just a few PCs to share resources and information, or want to open the lines of communication among all the PC users in your department, you can find everything you need from the pros at AST.

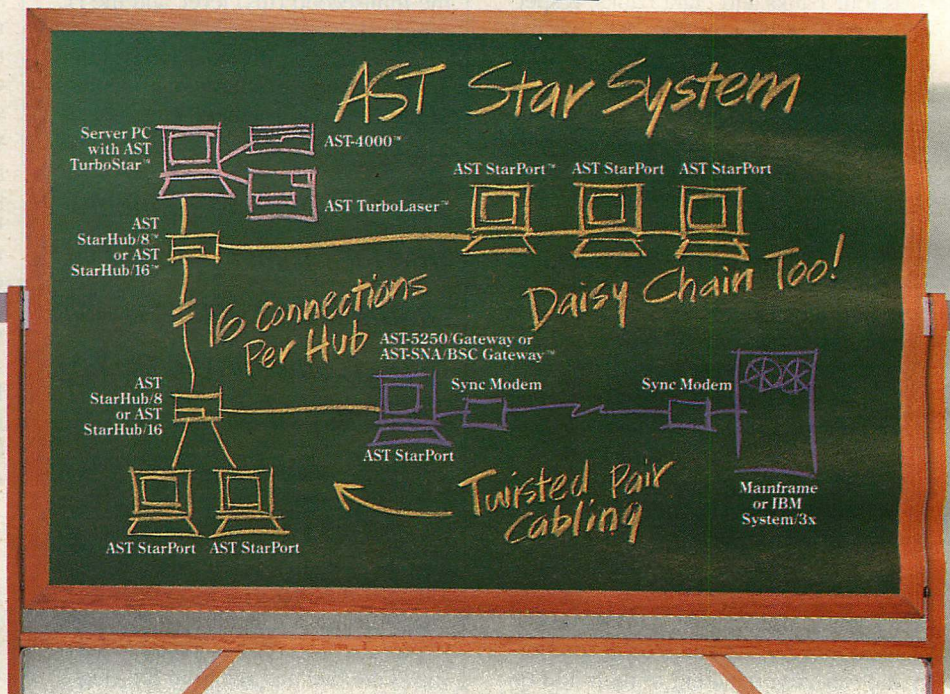

**Designed to Last.** With so many LANs on the sidelines today, it's important to buy a network that you can continue to use and expand tomorrow. AST provides a complete LAN solution, one that provides room for growth to support your changing business. And AST offers other resources you'll share in your local area network—such as our laser printer, storage subsystem and gateways—to ensure total system compatibility.

**Industry-Standard Protection.** Designed to meet the IEEE 802.3 StarLAN specification, AST Star System

protects your investment by ensuring continued compatibility with future LAN products. And complete NETBIOS emulation allows you to take full advantage of the growing league of application software packages designed for the IBM-NETBIOS interface.

**Versatile Starting Formations.** The AST Star System utilizes both bus (daisy chain) and star topologies to give you greater flexibility in designing your network gameplan. For the most efficient, yet economical way to link small groups of

up to 10 users, we recommend our Work Group Configuration. This daisy chain layout enables users located within a 400-foot distance to share high-speed laser printers, hard disk subsystems and multiuser applications, such as the AST-5250/Gateways™. Our Departmental Configuration connects up to 64 users spread across one or more departments, up to 8000 feet end-to-end. Daisy chains may also be connected to network expansion units (hubs) within the configuration; thereby, allowing you to maintain previously configured work groups.

**Simple Start-Up.** You don't have to fumble with a tangled jumble of hardware to get your network up and running. The AST Star System consists of easy-to-

install adapter cards and hubs, and uses telephone-type twisted pair cabling for simple installation. To start off, purchase the AST Star System Starter Kit. Even a rookie can quickly connect two PCs using this complete hardware/software solution.

For more information on how you can quarterback your own all-star LAN, call our Product Information Center at (714) 863-1480. Or send the coupon below to AST Research, Inc., 2121 Alton Avenue, Irvine, California 92714-4992.

TMS38030 System Interface is analogous to the IBM Attachment Interface, the TMS38010 communications processor to the IBM 16-bit processor, the TMS38020 protocol handler to the twin IBM protocol handler chips, and, finally, the TMS38051 ring interface transceiver and the TMS38052 ring interface controller to the IBM front end.

The IBM chip set uses an 8-bit shared memory interface, while TI depends on a DMA channel. The TMS380 reference book provides a sample schematic for an AT adapter card. Using the 16-bit DMA feature of the AT, the performance of the adapter card is comparable to that of the IBM set.

The TI communications processor (CP) is a dedicated, 16-bit CPU with 2.75KB of on-board RAM. The CP executes the firmware contained within the 16KB ROM on the TMS38020. Furthermore, the CP can access an additional 42KB of external RAM or ROM.

The TI protocol handler (PH) executes the functions of IEEE 802.5, LAN management services, ring operation, and diagnostics of the chip set. In accordance with the 802.5 specification, the PH implements differential Manchester encoding/decoding and frame-address recognition (group, local, and function). The PH contains four DMA channels, two for transmit and two for receive. In addition, all data paths and registers contained in the chip are parity-checked for increased reliability and integrity of operation.

TI's system interface (SI) provides a maximum 40-Mbps data transfer using its built-in DMA controller. The host system bus interface can be programmed to handle two major families of processors: the Intel 8086 and the Motorola 68000. The DMA feature can handle linked lists within the host memory. Commands (for example, TRANSMIT, RECEIVE, and READ ERROR LOG) are sent from the host to the SI via command blocks within a high-level command structure.

The ring interface is handled by the TMS38051 interface and TMS38052 interface controller. The ring interface contains a phase lock loop for clock recovery, data detection, and phase alignment. It provides the clock for the ring, when in active monitor mode, as well as the phantom drive signal for the MAU, a loop-back path for diagnostics, and error detection of wire faults.

A major difference between the two chip sets is the lack of an 802.2 interface in the TI set (which is one reason for the lag in third-party support of this set). But the 802.2 is a standard

that is still evolving. The MAC specification seems to be the only *established* aspect of the Token-Ring. This lack of a completely established 802.2 standard is causing compatibility grief among third-party vendors. IBM's move to separate 802.2 from 802.5 in the same chip set appears to reflect its concern.

Surprisingly, IBM is using TI's chip set in the adapter card for the RT PC. It seems strange that IBM did not mention this fact in its original press announcement in order to help underscore compatibility between the two chip sets. The problem for developers is that the interfaces to use this RT Token-Ring adapter are as yet unavailable. Why did IBM go outside for this adapter? Possibly because it wanted an RT Token-Ring adapter quickly and did not have the resources at the time to develop it.

Users who want to achieve IEEE 802.2 compatibility with the IBM Token-Ring should follow IBM's lead (or even TI's, because some IBM/TI data link

**A** token-holding timer controls the maximum amount of time that a station can use the ring before passing on the token.

commands are not published by IEEE), but not IEEE's. A major problem is that published standards (in book form) appear at least six months to a year behind the final drafts, and IBM is influencing on IEEE 802.2 and IEEE 802.5. For example, only IBM has "reserved" 802.2 SAPs in addition to those defined by IEEE, and only IBM is trying to change the rules of the Open Systems Interconnect (OSI) model developed by the International Standards Organization (ISO), by submitting its *source routing* technique (discussed later) to IEEE 802.2 (although this, too, is expected to become a standard). This appears to be a violation of the spirit of OSI, because source routing is part of an internetworking protocol that belongs in the network layer, not the data-link layer. It is also noteworthy that, instead of using a traditional bridge, the remainder of the network-layer-routing decision is made by individual workstations; therefore, it is distributed.

Although unconfirmed, the TI chip set is said to be capable of handling a

higher-speed ring, up to 16 Mbps. Only the front-end chips are specified to 4 Mbps; the others are specified in the TMS380 user's guide as being functional to 16 Mbps. To support data rates higher than 4 Mbps, TI has only to upgrade the ring interface and ring interface controller chips; most likely, the two chips will be combined into one package. TI probably will have a one-chip token-ring controller (in plastic) available by mid-1987.

## PROTOCOLS AND INTERFACES

IBM's contributions to the IEEE 802.5 standards committee forecasted the formal introduction of IBM Token-Ring products. As a result of its involvement, IBM has been the most influential company in shaping the 802.5 standard (in fact, the chairman of the 802.5 standards committee is from IBM/Raleigh).

**IBM Token-Ring/IEEE 802.5 Media Access Control Protocol.** The 802.5 Token-Ring Access Method and Physical Layer Specification defines the MAC sublayer of the data-link layer and the physical (signaling) protocols. Within the 802.5 specification, the frame format is defined, including delimiters, addressing, and frame-check sequences. Also defined are MAC frames, timers, and priority stacks. At the physical layer, symbol encoding and decoding, symbol timing, and latency buffering are designated. Although not part of the ISO physical-layer definition, 802.5 defines both the 1-Mbps and 4-Mbps, shielded twisted-pair attachment of the station to the medium, including the definition of the medium interface connector.

The 802.5 standard also describes services provided by the MAC sublayer to the network management and LLC sublayer, and the services provided by the physical layer to network management and the MAC sublayer. These services are defined in terms of service primitives and associated parameters, similar to the way in which the 802.2 standard is defined.

By definition, a token-ring consists of a set of *stations* connected serially by a transmission medium in which information is transferred bit by bit from one active station to the next. A station regenerates and repeats each bit, thus acting as a repeater when active. According to the 802.5 standard, a station is an entity that "serves as the means for attaching one or more devices (terminals, workstations) to the ring for the purpose of communicating with other devices on the network."

**Operation.** A station that has access to the medium transfers information onto

# WE PULLED THE PLUG ON v1.1

**CLARION v1.0 \$295.**

(former actuator shown at something other than actual size)

**CLARION v1.1 \$395.**

(artist's conception of no actuator at any size)

## YES, WE HAVE NO ACTUATOR.

The Actuator was a pass-thru hardware key that enabled CLARION and its Applications to run.

### It's no longer required.

With the Actuator, CLARION was *never* copy protected *and still isn't*.

All you needed was an IBM® PC, XT, AT or true compatible, a hard disk drive, 320KB of memory *and a parallel port*, for connection of the CLARION Actuator.

Well, you don't need the parallel port.

At least not to run CLARION v1.1 and all future releases.

Because we've pulled the plug, *forever*.

## IF YOU ALREADY HAVE CLARION 1.0

It's because early on you recognized CLARION's sublime fitness for writing *commercial applications*.

You envisioned how CLARION gives the power of a true business language, a superior user-interface,

and exceptional data-base management prowess.

To show that we really appreciate your *pioneering spirit* as well as your business, as a CLARION 1.0 licensee, you may upgrade to version 1.1 for only \$100.

We're also dedicated to making applications programmers' professional lives more rewarding.

CLARION, and now v1.1 delivers on that promise.

## WHY YOU NEED v1.1

You're losing money every minute you spend programming in something *other than CLARION 1.1*.

That's because we've listened to CLARION 1.0 users and made many exciting improvements, including *free run-times*

and adding two new labor-saving utilities.

**Converter** is a utility that takes your dBase®, DIF, and DOS files to CLARION file structure or vice versa.

**Crossrefer** provides nifty maps that let you find out who did what to whom and why your GROSS—PAY variable is less gross.

So call **1-800/354-5444** now to order CLARION v1.1.

You get all of this power, no copy protection, no Actuator, and *free run-times* for only \$395 plus a nominal fee for shipping and handling.

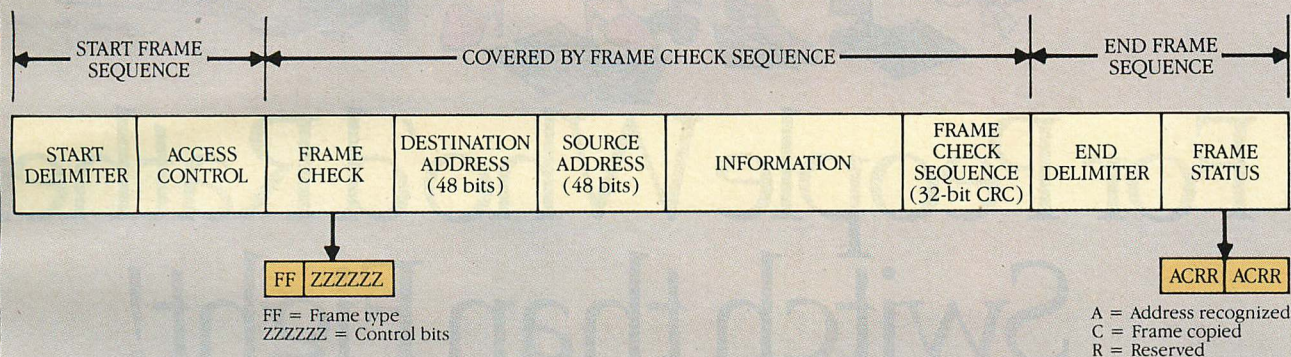

Or call us for our treacherously convincing 16 page color brochure, and reprints of major reviews. Either way the 800 call is a freebie.

**1-800/354-5444**

**FIGURE 2:** Token Format and Frame Format**TOKEN FORMAT****FRAME FORMAT**

The frame format is used for sending MAC and LLC messages to the destination station(s). The information field is optional.

the ring where it circulates from one station to the next. A station recognizes its address, and then copies the information as it passes "through" the interface. The source station that transmits the information is responsible for removing the information from the ring, preventing further circulation.

When a token is detected by a station, it may transmit its information onto the medium. When a token is "captured" by a station, it modifies the start-of-frame sequence and appends the appropriate control and status fields, address fields, information field, frame-check sequence, and the end-of-frame sequence. To make sure that all stations have fair access to the ring, a token-holding timer controls the maximum time a station can use the ring before passing the token.

Multiple levels of priority are available depending upon the class of service required, such as synchronous (3270-type data streams) and asynchronous (interactive) data transmission. An immediate network recovery has the highest priority. The allocation of priorities is performed among the stations active on the ring.

One innovative aspect of the 802.5 specification is built-in error detection

and recovery mechanisms (what IBM calls the RAS, for reliability, availability, and serviceability) provided to restore network operation in the event of failed medium or medium transients (insertion and removal of stations). Detection and recovery mechanisms operate under a network monitoring function that is performed in a specific station with backup monitoring capability by other stations in the network.

**Frame formats.** Formats can be divided into two types: token and frames. In the accompanying figures, the formats (generally described in terms of 8-bit fields, or octets) are depicted in the sequence in which they are transmitted on the medium, with the left-most bit (the most significant bit) transmitted first.

The token, the format of which is shown in figure 2, is the mechanism by which access (transmission) to the ring is passed from one station to another. The frame format, also shown in figure 2, is used for transmitting both MAC and LLC messages to the destination station(s). The information field is optional and can contain arbitrary data (that is, it does not have to contain 8-bit bytes).

The access control field contains priority bits, a token bit, a monitor bit, and reservation bits. The lowest priority

is 000, the highest, 111. A token bit of 1 indicates that a frame follows. When a station wants to transmit a protocol data unit (PDU), it detects a token with a priority equal to or less than its own; it then may change the token to a start-of-frame sequence and send the PDU. The monitor bit prevents a token with priority greater than 0 or a frame from continuously circulating on the ring. The bit is transmitted as 0 in all frames and tokens, except for the monitor that inspects and modifies it.

Reservation bits allow stations to request the next token be issued at the requested priority. The station currently transmitting a frame is responsible for generating a new token at a higher priority (the PPP bits are set), and for changing the token back to the lower priority when the requesting station has completed frame transmission.

The frame control field indicates the frame type, along with control bits. When FF is set to 00, this indicates a MAC frame; 01 indicates an LLC frame; and 1x is an undefined format reserved for future use.

Each frame contains destination and source address fields. The 802.5 standard permits the field size to be either two octets (16 bits) or six octets

# For People Who'd Rather Switch than Fight!

The ultimate printer-sharing switch has arrived...

## Here's the Logical Connection™!

It happens all the time: your entire office staff is having a "get-together" by the printer. And if you haven't found the solution to this bottleneck yet, it's time you got the connection: The Logical Connection.™

## No more slow-downs.

The Logical Connection™ is the ultimate printer-sharing switch because it lets *everyone* share the same printers (or other peripherals), at the same time! With no downloading, disk-shuffling, cable-swapping, switch-flipping or any of the other thousand natural shocks that sharing's heir to. The Logical Connection™'s big, smart buffer (256K, 512K model also available) will spool each document for sequential printing, so your computers can keep right on working. But wait, there's more...

## Long-distance switching.

What if your printers and computers are strung out all over the building? No problem, because you can "daisy-chain" up to 45 Logical Connections™ together. Over a single twisted-pair wire like telephone wire (which, by the way,

you probably already have *wired* all over the building). And each computer can choose which printer it wants to use, simply by issuing a pre-defined 8 character "selection string." Need more? Just hook a couple of Logical Connections™ up to a pair of cheap

problem. And if two devices have different handshaking, baud rates, word lengths, or parities, The Logical Connection™ will do all the conversions for you *automatically*, whenever they're needed. And it will never forget your configurations, because its memory is in battery-powered RAM.

## Why fight it?

So if you'd like to give *all* your computers instant access to *all* your printers (and plotters and modems and whatever else you'd like to hook them up to), *all* the time, why fight it any longer? Make the switch. Get The Logical Connection™ at your leading computer dealer today, or order direct from Fifth Generation Systems.

modems and let a roomful of computers talk to a roomful of printers across the country... or across the world.

## Automatic Data Conversion

If you want to run a parallel daisy-wheel and a serial laser printer from the same computer port, no

## TOKEN-RING

(48 bits). The IBM Token-Ring uses six octets for addressing. If the first bit is set to 0, it is an individual address. If set to 1, it is a group, or broadcast, address (all bits set to 1).

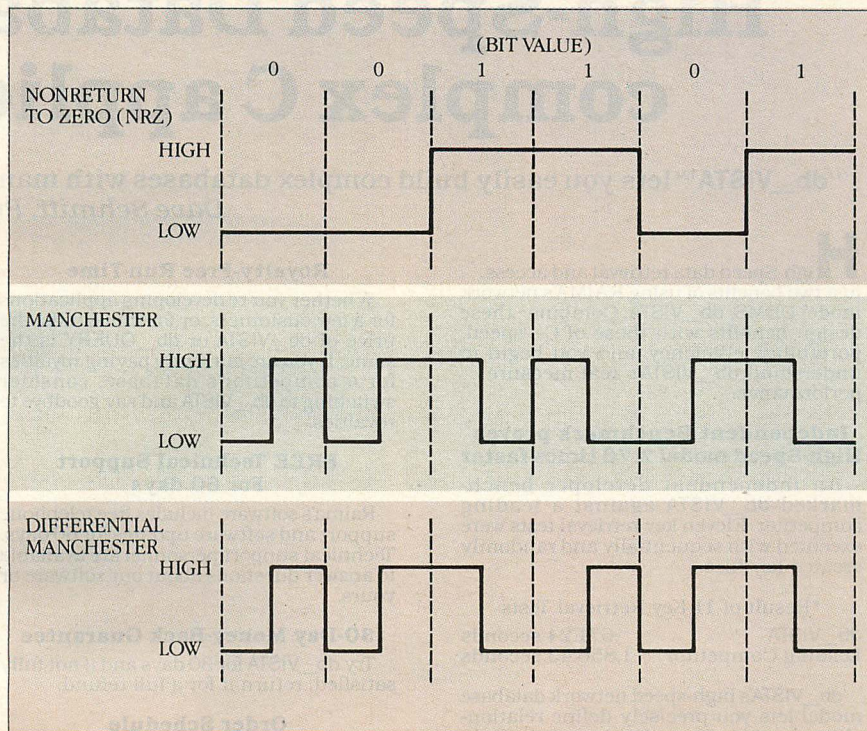

The second bit in the address field indicates whether the address is administered locally (set to 1) or universally (set to 0). The manufacturer assigns each station an address that is unique across the universe of LANs. (The manufacturer can obtain a set of 48-bit addresses from the IEEE; this formerly was administered by Xerox for EtherNet LANs.) On the IBM PC Adapter, this address is burned into ROM.

The frame status field contains address-recognized bits (A bits), frame-copied bits (C bits), and reserved bits. A and C bits are transmitted as 0. When the receiving station recognizes its address, it will set the A bits to 1. If it can copy the frame into its receive buffer, the C bits are set to 1. This allows the sending station to determine if the station is nonexistent or inactive on the ring; if the station is active but unable to copy the frame; or if the station is active and did copy the frame.

**Physical layer.** The physical layer uses *differential Manchester* encoding to transmit and detect four different symbols: a binary 0, a binary 1, a nondata-*J*, and a nondata-*K*. The *J* and *K* symbols are violations of Manchester coding: code violations allow the interface to detect delimiters, eliminating the overhead of bit stuffing (which is used in SDLC—synchronous data link control). Differential Manchester encoding is similar to Manchester encoding in that mid-bit transition is used to provide clocking (see figure 3). The encoding of 0 or 1 is represented by the presence or absence of a transition at the beginning of the bit period, as opposed to the midbit transition also representing the code, as is used in Manchester encoding.

Signal timing is provided by the monitor. All other stations track the frequency and phase of the incoming signal. Although the mean data signaling rate around the ring is controlled by the monitor, segments of the ring can instantly operate at speeds slightly higher or lower than the frequency of the monitor, an effect known as *jitter*. The active monitor in the adapter provides the master clock for transmission of the token. A token is sent around the ring with a transmission rate of 4 MHz. When it arrives back at the monitor, it is decoded again via the differential Manchester decoder. The time to decode the token will vary according to the amount of jitter on the ring.

**FIGURE 3:** *Differential Manchester Encoding*

Differential Manchester encoding, like Manchester encoding, is self-clocking. The midbit transition provides both the clocking edge and the value for the bit.

The active monitor includes a time-delay mechanism called a *latency buffer* that serves two purposes. First, it ensures that enough latency bits are present on the ring so that the token can circulate continuously. At least 24 are necessary to accommodate a minimal LAN configuration of two machines: the token is 24 bits long and only one token can be on the ring at any one time. Second, it compensates for the speed and phase variations introduced in the ring. If the token speed decreases as it goes around the ring, it takes longer for the entire token to be clocked into the active monitor. The latency buffer must expand to ensure the entire token has been clocked onto the active monitor before the new token is transmitted. According to IEEE specification, the latency buffer should accommodate jitter to  $\pm 3$  bits; thus, the minimal size for the latency buffer is 27 bits. It can contract to 24 bits and expand to 30 bits to handle worst-case jitter.

**IBM Token-Ring/IEEE 802.2 Logical Link Protocol.** The PC Token-Ring adapter board executes functions of the LLC sublayer of IEEE 802 LAN protocol. The LLC sublayer is the upper portion of the data-link layer; it functions independently of the network-dependent MAC.

The LLC standard describes the sublayer interface service specifications

to the network layer (layer 3), the MAC sublayer, and the LLC sublayer management function. This standard provides a description of peer-to-peer protocol procedures that are defined for the transfer of information and control between any pair of data-link-layer SAPs that are on a LAN.

Two classes of LLC operation are provided. Class I provides connectionless service; class II provides both connectionless, and connection-oriented service. The IBM token handler provides an interface to class II service.

Data transfer via connectionless service arranges for network entities to exchange link service data units (LSDUs) without the establishment of a data-link-level connection. The data transfer can be point-to-point, multicast (group), or broadcast (to all entities).

Connection service provides the means for establishing, using, resetting, and terminating data-link-layer connections. These are point-to-point connections between link-layer service access points (LSAPs). This service provides data-link-layer sequencing, flow control, and error recovery. Other services include connection reset (established connections can be returned to the initial state), connection termination (a network entity can request or be notified of data-link-layer connection termi-

# C Programmers! High-Speed Database tames complex C applications

"db\_VISTA™ lets you easily build complex databases with many interconnected record types..."  
Dave Schmitt, President, Lattice, Inc.

**H**igh-Speed data retrieval and access... just two benefits of using RAIMA's network model DBMS, db\_VISTA. Combine these design benefits with those of C—speed, portability, efficiency, and you begin to understand db\_VISTA's real measure... performance.

## Independent Benchmark proves High-Speed model 2.76 times faster

An independent developer benchmarked db\_VISTA against a leading competitor. Eleven key retrieval tests were executed with sequentially and randomly created key files.

### \*Result of 11 Key Retrieval Tests

db\_VISTA : 671.24 seconds  
Leading Competitor : 1,856.43 seconds

db\_VISTA's high-speed network database model lets you precisely define relationships to minimize redundant data. Only those functions necessary for operation are incorporated into the run time program.

## Portable DBMS Applications with db\_VISTA

For maximum application portability, every line of db\_VISTA's code is written in C and complete source code is available. db\_VISTA operates on most popular computers with several operating systems supported. So whether you write applications for micros, minis, or mainframes... db\_VISTA is for you.

## How db\_VISTA works...

Design your database and compile your schema file with the database definition language processor. Develop application programs, making calls to db\_VISTA's C functions. Edit and review your database using the Interactive Database Access utility. Compile and link your C program with the db\_VISTA runtime library, and your application is ready to run.

## Multi-user and LAN capability

Information often needs to be shared. db\_VISTA has multi-user capability and supports simultaneous users in either multi-tasking or local area networking environments, allowing the same C applications to run under UNIX, MS-DOS, and VAX VMS.

## db\_QUERY™ lets you ask more of your database

db\_QUERY is a linkable, royalty-free, SQL-based ad hoc query and report writing facility. It provides a user-friendly relational view of a network-model database. Use it directly or design an interface for the inexperienced to generate powerful queries and reports.

## Royalty-Free Run-Time

Whether you're developing applications for a few customers, or for thousands, the price of db\_VISTA or db\_QUERY is the same. If you are currently paying royalties for a competitor's database, consider switching to db\_VISTA and say goodbye to royalties.

## FREE Technical Support For 60 days

Raima's software includes free telephone support and software updates for 60 days. Technical support personnel are available to answer questions about our software or yours.

## 30-Day Money-Back Guarantee

Try db\_VISTA for 30 days and if not fully satisfied, return it for a full refund.

## Read what others say...

"If you are looking for a sophisticated C programmer's database, db\_VISTA is it. In either a single or multi-user environment, db\_VISTA lets you easily build complex databases with many interconnected record types. The multi-user implementation handles data efficiently with a LAN, and Raima's customer support and documentation are excellent. Source code availability and a royalty-free run-time is a big plus!"

Dave Schmitt, President  
Lattice, Inc.

"My team has developed a sophisticated PC-based electronic mail application for resale to HP customers. db\_VISTA has proved to be an all-round high performer in terms of fast execution, flexibility and portability, and has undoubtedly saved us much time and development effort."

John Adelus, Hewlett-Packard Ltd.  
Office Productivity Division

"On the whole, I have found db\_VISTA easy to use, very fast with a key find, and powerful enough for any DBMS use I can imagine on a microcomputer."

Michael Wilson, Computer Language

## db\_VISTA Version 2.2

### Database Record and File Sizes

- ◆ Maximum record length limited only by accessible RAM
- ◆ Maximum records per file is 16,777,215
- ◆ No limit on number of records or set types
- ◆ Maximum file size limited only by available disk storage
- ◆ Maximum of 255 index and data files

### Keys and Sets

- ◆ Key length maximum 246 bytes
- ◆ No limit on maximum number of key fields per record—any or all fields may be keys with the option of making each key unique or duplicate
- ◆ No limit on maximum number of fields per record, sets per database, or sort fields per set
- ◆ No limit on maximum number of member record types per set

### Operating System & Compiler Support

- ◆ Operating systems MS-DOS, PC-DOS, UNIX, XENIX, SCO XENIX, UNOS, ULTRIX, VMS
- ◆ C compilers: Lattice, Microsoft, DeSmet, Aztec, Computer Innovations, XENIX and UNIX

### Features

- ◆ Multi-user support allows flexibility to run on local area networks
- ◆ File structure is based on the B-tree indexing method and the network database model
- ◆ Run-time size, variable—will run in as little as 64K, recommended RAM size is 256K
- ◆ Transaction processing assures multi-user database consistency
- ◆ File locking support provides read and write locks on shared databases
- ◆ SQL-based db\_QUERY is linkable
- ◆ File transfer utilities included for ASCII, dBASE optional

### Utilities

- ◆ Database definition language processor
- ◆ Interactive database access utility
- ◆ Database consistency check utility
- ◆ Database initialization utility
- ◆ Multi-user file locks clear utility
- ◆ Key file build utility
- ◆ Data field alignment check utility
- ◆ Database dictionary print utility
- ◆ Key file dump utility
- ◆ ASCII file import and export utility

\*The benchmark procedure was adapted from "Benchmarking Database Systems: A Systematic Approach" by Bitton, DeWitt and Turbyfill, December 1983.

## TOKEN-RING

nation), and connection flow service (provides flow control of data associated with a specified connection).

**Adapter handler.** All interfaces to the PC Adapter require the adapter handler, the Token-Ring Extended User Interface. TOKREUI is packaged with the adapter card on a 5¼-inch diskette as TOKREUI.COM. Its relationship to the various interfaces is shown in figure 4.

TOKREUI removes the user from the adapter's complexities, especially its complex asynchronous nature. Essentially, it provides a direct (MAC) and data-link-control (DLC) interface to the adapter. Interfacing to NETBIOS or APPC/PC requires additional software to perform MAC and DLC functions (this software is included with the NETBIOS emulator and APPC/PC).

After DOS 3.2 is booted on a PC attached to the Token-Ring, TOKREUI is invoked by entering: TOKREUI NA0, SR0, NA1, SR1. The parameters are optional; NA0/NA1 indicates node address (burned-in or locally entered), and SR0/SR1 is the shared RAM address for Adapter 00/01. Once loaded, TOKREUI occupies approximately 7KB of RAM.

If the command has been issued correctly, TOKREUI then places its entry point into interrupt 5CH. This interrupt is shared by the NETBIOS interface. Therefore, the command in the command control block (CCB) is examined. If it is less than four, then TOKREUI takes over; if it is greater than four, it may be for NETBIOS.

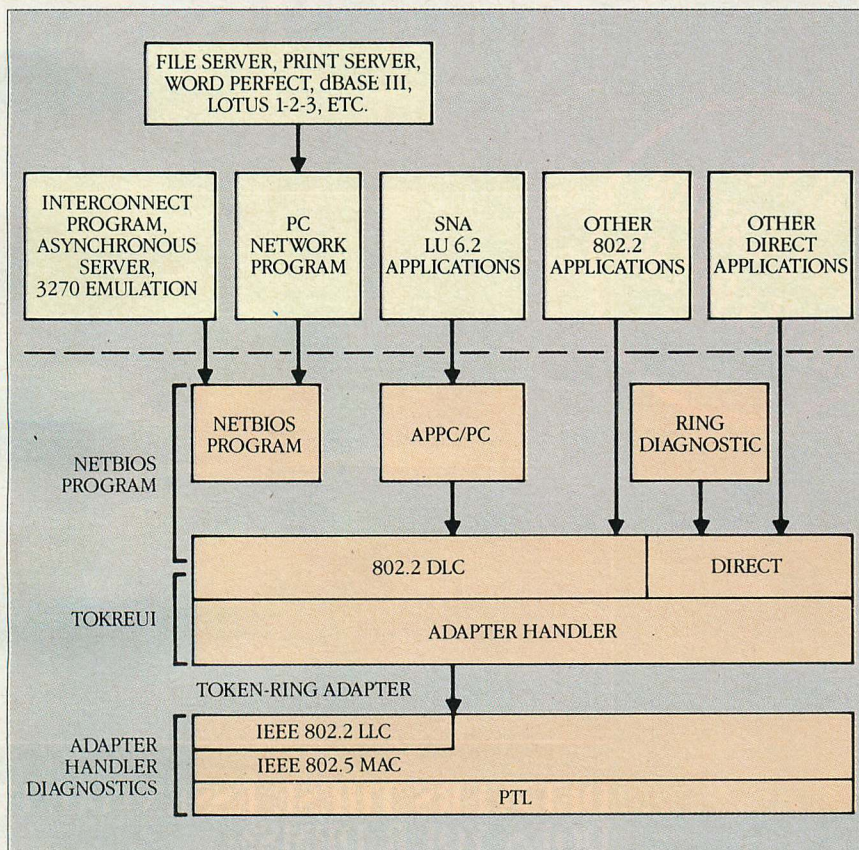

This direct interface enables the user to write a custom data-link-control procedure or, for an application, obtain error status and logs and generally to control the adapter. Primitives are included to configure and manage the adapter microcode and to support auxiliary commands to support buffer management, timers, and operational characteristics of the TOKREUI.

The data-link interface provides the IEEE 802.2 class II (connection-oriented) service interface with link-station characteristics. These include support for node hierarchy with the station component; the SAP and connect components; XID (exchange identification) and TEST commands issued on a per-SAP basis; and XID and TEST responses issued by the station component (transparent to local applications).

The SAP is an 8-bit address through which an application is identified to the DLC software. SAPs let multiple applications share the same adapter, such as APPC/PC and NETBIOS, simultaneously.

The CCB serves as the interface between TOKREUI and the application.

**FIGURE 4:** *Token-Ring Adapter Handler and Interfaces*

TOKREUI, the Token-Ring Extended User Interface, provides a direct (MAC) and data-link-control (DLC) interface to the adapter. Interfacing to NETBIOS or APPC/PC requires additional software to perform MAC and DLC functions.

The application initiates a command by issuing interrupt 5CH with the PC's 8088 or 80286 EX:BX register pair pointing to the CCB. The CCB contains the adapter number (0 or 1), the command code to be executed, the return code, a pointer to the TOKREUI work area, a pointer to the CCB queue (commands can be queued), command completion address (user appendage), and an optional pointer to a list of additional parameters for some commands.

When a valid CCB is received, TOKREUI will set the return code in the CCB to FFH indicating that a command is in process. The application being used must not change the CCB until the return code is set to something other than FFH by TOKREUI.

A user appendage is an exit point to a subroutine where TOKREUI can transfer information to the application asynchronously. Information is transferred upon completion of a command or error condition, and an interrupt to the PC is generated. The appendage is entered via a CALL FAR instruction with interrupts masked off. The programmer is warned that the appendage code

must be reasonably fast, or timer ticks (18.2 ticks per second) will be lost. The appendage issues an IRET to return. User appendages are needed for command completion, adapter check, and ring status check, as well as for received data, DLC change, and PC error.

TOKREUI manages buffer pools within the PC's memory, as allocated by the application. Buffer pools are associated with SAPs and are defined using the DLC.OPEN.SAP command for a given SAP or by DIR.OPEN.ADAPTER for a direct-station SAP. (After opening a SAP via DLC.OPEN.SAP, connectionless service is available. Connection-oriented services are opened by using the command DLC.OPEN.STATION; the number used depends upon the manner in which the 8KB/16KB shared RAM is allocated. A practical number of connection-oriented services is 16.)

All link stations in the ring associated with the same SAP share the same buffer pool. A link station continues to receive frames while buffers are available and when a RECEIVE command has been issued by the application. A buffer pool is required for the

DEVELOPERS

... DELIVERS THESE ESSENTIAL FEATURES.  
DOES YOUR DBMS?

MDBS III is more powerful than most mainframe data base management systems... and less expensive. MDBS III was designed for serious application developers like you. Like the developers of Solomon III, the "Number One" accounting system. And all the others who demand these essential features MDBS III provides:

**DATA STRUCTURING**—So flexible it captures any data relationship you can imagine. So comprehensive you'll design complex data bases faster than ever.

**TRUE MULTI-USER**—Few DBMSs give you as many facilities to guard against haphazard concurrent data modification as MDBS III does, down to the locking of individual data records.

**PERFORMANCE**—MDBS III gives you fast data modification and retrieval plus extensive performance tuning facilities.

**DATA INTEGRITY**—MDBS III provides airtight integrity assurances... from range checking to transaction-logging to enforcement of data relationships... *all automatically.*

**PHYSICAL DATA PROTECTION**—You get automatic recovery from media as well as from physical data destruction.

**DATA SECURITY**—Protect your data using passwords, encryption, and read/write access down to the field level.

**PORTABILITY**—MDBS III runs on a range of mini and micro computers, including LANs, and supports a variety of host language interfaces.

**SUPPORT**—**mdbs** is there when you need us, with in-depth seminars, telephone support, individual consulting and contract programming to help you develop and install your applications.

Call us today at 800-344-5832 for more information; in Canada or Illinois, dial 312-303-6300. Or write **mdbs**, P.O. Box 248, Lafayette, IN 47902, TELEX 209147 ISE UR.

## TOKEN-RING

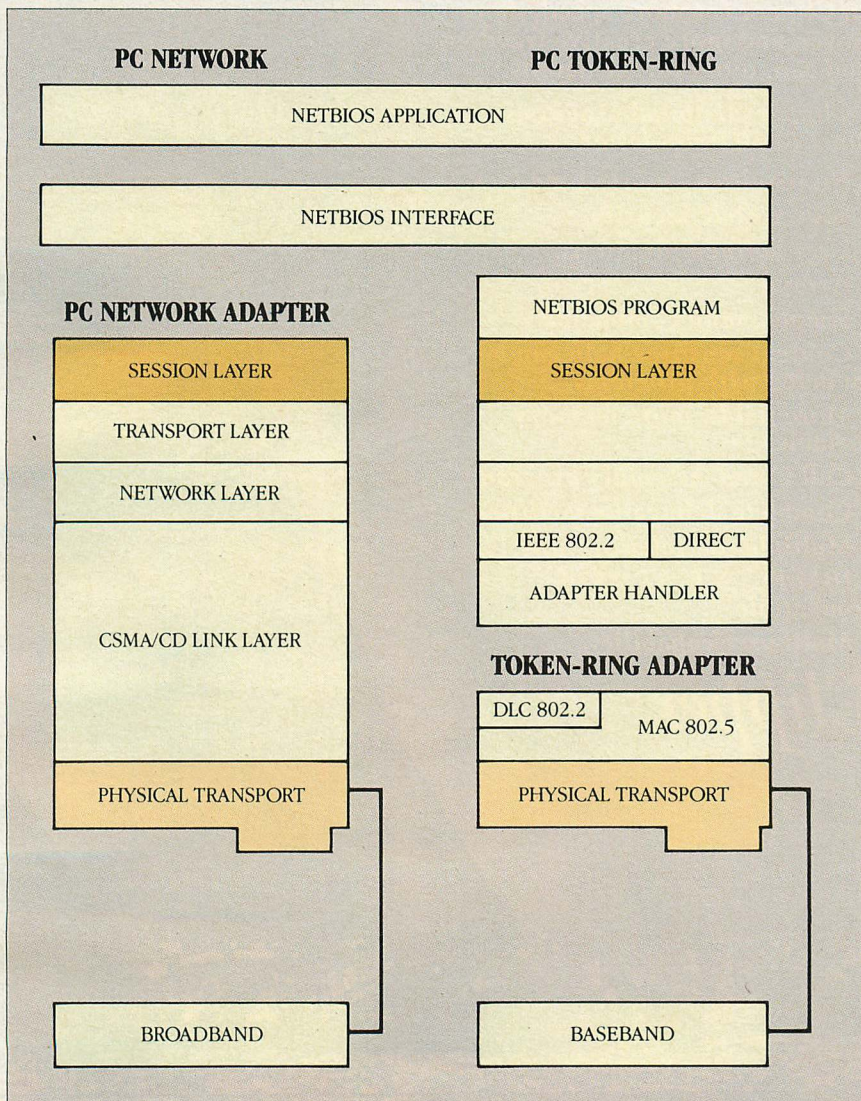

RECEIVE command, but optional for SEND (a pool is handy, for example, in performing a "chained" send).

After the application issues a RECEIVE and the adapter receives a frame, the following sequence takes place: the adapter interrupts TOKREUI, which uses the BUFFER.GET code to get the appropriate number of buffers from the (SAP) buffer pool; TOKREUI moves the data from the shared RAM to the buffer(s) (if the buffer is too short, an additional buffer is requested automatically); TOKREUI exits via the user appendage defined by RECEIVE (the received data appendage), with the register pair ES:BX pointing to the first receive buffer (but only if the received frame fit). The frame is now in the buffer. After the application "uses" the frame, it issues the FREE.BUFFER command to free the buffer to avoid losing frames due to insufficient memory.

When an application needs to send data, it may use its own buffer space or space provided by the buffer pool (by issuing a BUFFER.GET). For efficiency in connection-oriented data transfer, the application may specify the number of outstanding transmits (by setting the MAXOUT parameter) before the transmit complete interrupt is posted. (The MAXOUT default is eight transmits.) When the transmit-complete user appendage is taken, all CCBs associated with the transmit are chained together. At this point, the following state exists: the register pair ES:BX points to the first transmit CCB issued; offset four of the CCB contains the offset of the next CCB in the chain; offset six of the CCB contains the segment of the next CCB in the chain; all CCBs in the chain are marked complete and contain the same return code value; and the user appendage taken is the command-complete appendage of the first CCB.

The initialization sequence takes up to 27 seconds for the first active adapter on the Token-Ring, and 10 to 20 seconds for each additional activated adapter. During this time, diagnostics are performed, including a self-test on the adapter hardware, a loop-back test to or from the MAU, and a check to ensure that a monitor station exists. TOKREUI makes three attempts before reporting any failure to the application. **NETBIOS.** The Network Basic Input/Output System was originally developed for the IBM PC Network by Sytek. Based on Sytek LocalNet/20 protocols, it provides a session-level interface to the host, with provisions for datagram service. Supported services include peer-to-peer communications and naming.

**FIGURE 5: NETBIOS on PC Network and the Token-Ring**

On the Token-Ring, the host processor must operate the protocols, whereas on the IBM PC Network, an on-board 80188 performs the protocol processing.

The IBM PC Network Program relies on NETBIOS for its operation, as do other programs. The Network Program implements the server message block (SMB) protocol, and provides the user with workstation functions (redirector, receiver, and messenger) and nondedicated server functions (workstation, plus server functions).

Figure 5 shows how NETBIOS is implemented in the two networks. On the Token-Ring, the host processor must operate the protocols (with NETBIOS consuming 40KB of host RAM); on the PC Network, an on-board 80188 does the protocol processing. Interestingly, IBM has shown that the Token-Ring NETBIOS implementation (in terms of raw data rate) operates faster by better than a factor of two than the PC network. This is due largely to the

overhead generated among four communicating devices on the PC Network Adapter and the way in which NETBIOS protocols were programmed.

The host processor communicates with NETBIOS via the message control block (MCB); this unit is called the network control block (NCB) in the PC Network. Once the MCB is set up by the host, it interrupts NETBIOS for service. NETBIOS then takes over and invokes the necessary protocols (if required) to perform the service that is requested by the host.

The data-link layer provides the link access protocol (LAP) to the PC Network or Token-Ring. In this layer, the two networks really diverge. The Token-Ring provides IEEE 802.2 DLC and 802.5 MAC. The PC Network provides a proprietary DLC and 802.3

Clipper is the fastest dBase III and dBase III Plus™ compiler available. Nothing else comes close. When performance counts, experts rely on Clipper for more speed, more power, and more creative freedom. You can, too. Call for details.

- Clipper compiled programs run 2 to 20 times faster.
- No royalties...no runtime fees.
- Source code security.
- User defined functions.
- Arrays.
- Simple menu commands.
- Context sensitive help can be included with programs.
- More fields; more memory variables.
- Call C and Assembly programs.
- Complete debugging facilities.
- Multiple file relationships.
- IBM PC, XT, AT, 3270 compatible™.
- Multi-user capability.

(CSMA/CD and frame format) MAC. LAP is used to provide service for the packet transfer protocol (PTP).

The session layer provides host access to several protocols. The session management protocol (SMP) provides support for user sessions between nodes. SMP allows users to establish connection to a named process and is responsible for interacting with the name management protocol (NMP) within the local node for determination of the named-process address. Once the destination node is determined, the initiating SMP can communicate with the SMP within the destination node to provide session-level services. In conjunction with naming, the user datagram protocol (UDP) provides support for datagrams between two names (nodes).

The NMP provides for the binding of alias names and network addresses within the entire local network. NMP performs all name management services, including the translation of remote names to a network address. This portion of the protocol is the one most responsible for the time it takes to enter a NETBIOS network: the node will broadcast its name(s) to other stations (several times to ensure reception by all other stations). Broadcasting also is performed when SMP has to establish a connection with another name.

These session-level protocols are emulated by the Token-Ring NETBIOS emulator. In the Token-Ring implementation, the protocols communicate with the adapter handler, bypassing the network and transport layers. Vendors (such as AST Research and Novell) have already developed NETBIOS emulators for non-IBM hardware using protocols that are similar to the Xerox Network Systems (XNS) protocol.

In September 1986, IBM announced NETBIOS 1.1, operating under the 3270-PC Control Program 3.0, thus bringing the 3270-PC and 3270-AT officially into the Token-Ring. This allows the PC LAN Program redirector function (with no server capability) to function in the 3270-PC. More importantly, the 3270-PC is able to communicate with a token-attached 3174 controller for access to a System/370 host. On the down side, NETBIOS increased in size to 50KB (from 40KB) and the adapter handler to 15KB (from 7KB). But this is not a problem for the 3270-PC because it supports expansion RAM beyond 640KB for applications; however, the handler must reside in the lower 640KB.

The official name for the 3270-PC adapter handler is rather long—the IBM Token-Ring Network Personal Computer

Adapters Support Program 3270-PC. The handler is packaged with NETBIOS 1.1 and is slated to be available in early 1987. What sets this handler apart from the one for the rest of the PC family is that it provides an interface to the LLC functions of IEEE 802.2, thus bypassing the 802.2 supported functions on the PC Adapter (or Adapter II). Most likely, IBM will pursue this strategy with all future introductions: the RT PC adapter was first (no LLC support), followed by the 3270-PC (old adapter, but bypassing LLC support). IBM continues to enhance 802.2, making it difficult to commit to a firmware or VLSI-based implementation, as it did with the original PC Adapter and PC Adapter II.

Perhaps one of the best-kept secrets about NETBIOS is the IBM Remote NETBIOS Access Facility Program. This utility allows a remote PC to dial into a gateway PC on a Token-Ring or PC Network (via modem or IBM's ROLM CBX) and access the network resources as if

**I**n September 1986, IBM announced NETBIOS 1.1, thus bringing the 3270-PC and 3270-AT officially into the Token-Ring domain.

the remote PC were directly attached. The gateway PC is a nondedicated PC that can handle two RS-232 ports. Vendors such as Fox Research (10-NET), Novell (NetWare Remote), and 3Com (3+ Remote) also offer this capability through their LAN software. The virtual-disk speeds, however, will be limited to 9600 bps or slower.

**APPC/PC.** The Advanced Program-to-Program Communication is a specific implementation of the IBM System Network Architecture (SNA) LU 6.2 architecture (see "SNA Strategies," Art Krumrey, July 1985, p. 40). APPC/PC allows peer-to-peer applications to be written with PCs attached to the Token-Ring or with PCs attached to other PCs or larger IBM systems via the IBM SDLC adapter.

Essentially, a logical unit (LU) is a port through which an end user can access the SNA network to communicate with other end users or to access programs, directories, or links on other hosts. Specifically, LU 6.2 is an architecture that describes the formats and protocols for communications among dis-

tributed transaction programs in an SNA network. APPC/PC is an implementation of LU 6.2 on a physical unit (PU) 2.1 base for IBM PCs. APPC provides the means for writing applications that communicate on a peer-to-peer basis.

APPC allows this communication independently of the underlying system. It provides guaranteed delivery of data, as well as data format and session protocol transparency. No limit is set on the number of sessions or networks it can support. APPC/PC is loaded into the PC and remains resident, in the same manner as TOKREUI and NETBIOS. A PC application accesses APPC services through DOS interrupt 68H. The SAP assigned to APPC is 04H (F0H is assigned to NETBIOS).

An application converses with APPC using verbs. Verbs are parameter lists containing supplied parameters, returned parameters, and return codes. The parameters are supplied in an application-supplied buffer with the register pair DS:DX pointing to the first byte in the buffer. Interrupt 68H is then issued. Return parameters and return codes are generated by verb execution. Verbs fall into five categories: control, mapped conversation, basic conversation, network management, and other.

Control verbs set up and manage communications with another program. Mapped conversation (MC) verbs are issued by transaction programs that are the final users of the data exchanged. Basic conversation verbs are issued by LU service transaction programs, which provide services and exchange data for their transaction programs. A network management verb provides management services information to the local node and/or another node (a host, for example), which provides network problem determination. It can be used to provide ring and adapter failure information to the SYSLOG.

Still other verbs are used to define a user's own verbs using the same interrupt vector (68H) as APPC/PC. For example, the CONVERT verb is convenient for PC-to-large-host applications because it converts between the ASCII and EBCDIC character sets. TRACE provides a tracing of application program interface (API) invocations and messages that are sent or received. TRACE can log to any DOS device. The verbs DISABLE/ENABLE APPC control the operation of APPC, which must be disabled while performing another DOS function call. If not disabled, the PC may hang up if an APPC operation is interrupted.

APPC/PC consumes more than 160KB of RAM. An additional 21KB are

# ALL TOGETHER NOW WITH SIMPC...

## *leading communication software for IBM PCs*

SIM3278/PC — best known as SIMPC — is a versatile software package designed to provide IBM PC users with access to virtually any computer application in almost any location.

**Three types of terminal emulation in one software package.** When SIMPC is used in conjunction with SIM3278, Simware's host-based protocol converter, you can use your IBM PC as a 3278 model 2 terminal to communicate with your IBM host (without the need for any additional hardware, add-on boards or system modifications). SIMPC also enables you to access a DEC/VAX or any other non-IBM system that supports a VT100. And, you can communicate with any host that supports line-by-line mode.

**We wrote the music for PC-to-PC communications too.** In addition to complete, economical emulation for three types of terminals and error-free file transfer from PC to host in either full-screen or line-by-line mode, SIMPC also provides the capability to send data from PC to PC via XMODEM.

### **Conduct your band of PC users with SIMPC.**

Here are five more great reasons why data communications managers choose SIMPC:

- ☐ cost-effective data transmission using half-duplex communications;
- ☐ Simware's unique screen-rewriting technique saves time and improves productivity;

- ☐ online help, a menu system and a tutorial shorten the learning curve for novice users;
- ☐ an intelligent command processor enables you to develop application interfaces that automate and standardize routine procedures; and
- ☐ an unlimited right-to-copy corporate license means your PC network can grow to any size for a one-time price.

**Micro-to-mainframe is only one of our popular melodies.** Since 1982, Simware has released ten software products that help IBM mainframe sites running VM or MVS/VTAM reduce communication costs, improve productivity and accommodate new users as their organizations grow.

To find out how Simware's software-only approach to communications has provided outstanding performance to PC users around the world, call us toll-free at:

## TOKEN-RING

required for menus, as much as 5.5KB for each additional LU, and 2.5KB for each additional concurrent session.

### SERVICES AND APPLICATIONS

With the proper protocols and interfaces in place, the IBM Token-Ring provides a rich environment for a variety of software-supplied services and applications—some were introduced in conjunction with the new network and some were previously established.

**IBM PC Local Area Network Program.** The original IBM PC Network Program was designed to operate with DOS 3.1 and NETBIOS on the PC Network. To operate the program on the Token-Ring, the NETBIOS emulator and DOS 3.2 are required. The installation procedure is menu driven, and, once installed, the PC LAN Program can be operated by typing commands at the DOS prompt or via menus.

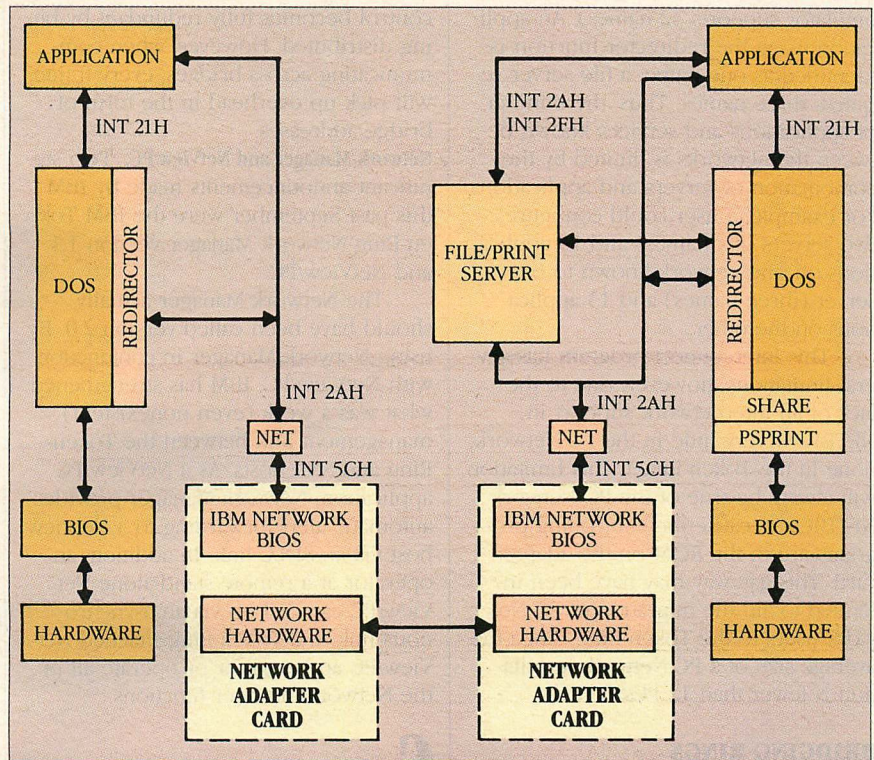

The PC LAN Program consists of a single executable file that can be called up in four ways: after the NET START command is executed, the user specifies a redirector, receiver, messenger, or server. The first three are for workstations, the last selection is a true, non-dedicated file/print server implementation that runs as a background task in a workstation. Depending upon its configuration, the PC LAN Program can use from 30KB to 186KB of RAM.

The redirector provides the most basic route to gain access to the local network. It intercepts the workstation's printer and disk I/O to send to a server; users also can send messages to other machines. The receiver, messenger, and server perform in a manner similar to the redirector, but with these added services: the receiver receives and logs messages to any device or file, the messenger allows a user to transfer files, and the server allows hard disks and printers to be shared.

Figure 6 presents a technical overview of DOS 3.2 and NETBIOS operation. It illustrates how DOS service interrupt 21H is intercepted, and, if necessary, how the interrupt is redirected over the network via the NET program to a server to perform an operation. An application can also bypass the NET program by issuing its own NETBIOS commands via interrupt 5CH.

This figure points out a major performance drawback to the IBM PC LAN Program: the server is dependent upon DOS for control of the shared resources. DOS was not designed to function as a server (even DOS 4.0, with its multitasking capabilities, must use the same FAT, storage, and so on). In re-

**FIGURE 6: DOS 3.2 and NETBIOS Redirection**

An application can bypass the NET program by issuing its own commands via interrupt 5CH, rather than being "well behaved" and using interrupt 2AH.

sponse, vendors such as 3Com and Novell have designed proprietary software (operating systems) and/or hardware to function as a file server.

**Asynchronous Communications Server.** This is a major new service introduced by IBM with the Token-Ring. The server (a PC) provides access to and from the network via two switched lines (per server) connected to a modem or IBM/ROLM CBX. It requires NETBIOS for its operation, and works with the Token-Ring and the IBM PC Network.

The server program runs in either a dedicated or a nondedicated PC. It allows specially programmed applications operating on the network to dial out from the network or outside applications to dial in to the network. The network must include a complementary application to service the incoming call. The server is a program and protocol specification only—on its own it does nothing. For example, IBM does not provide a network terminal emulation package that runs on a workstation and communicates with the server. The user or third party must supply the necessary applications software. Two applications can be set up as servers and communicate with each other via the LAN. This is useful for debugging new communications server applications in which one

server must provide "dummy" communications with another (acting as an application). Some vendors, including Microstuf (Crosstalk) and Software Publishing (PFS:Access), have adapted their programs to work with the server.

### Token-Ring/PC Network Interconnect Program

The Interconnect Program allows a dedicated PC to act as a gateway between the Token-Ring and PC Network or two PC Networks. A PC running only the interconnect program is physically attached to the two networks with one Token-Ring adapter card and one PC Network adapter card. Applications written to NETBIOS can communicate with devices on either network.

An IBM PC Network Program user, for example, can access programs or data on a server from one network to another. This requires the Interconnect Program to be preconfigured to identify the devices (or names) on each network that will be known to the other. The names cannot be dynamically changed during operation. The gateway receives messages from one network and forwards the messages to the other; an operator also can check device status and monitor gateway activities.

As many as 16 names for each network can be defined to the interconnect program (this is a limitation of the

NETBIOS implementation on the PC Network—the Token-Ring NETBIOS emulator supports 32 names). An application using the redirector function is identified as one name; a file server requires three names. Thus, the number of applications and services known between the networks is limited by the combination of servers and applications. For example, a user could configure two servers (six names) and 10 applications on one network known to one server (three names) and 13 applications on the other.

This interconnect program has several limitations, however, due to the lack of an internetwork support in NETBIOS (very little in the PC Network, none in the Token-Ring). This limitation will always be true of the PC Network NETBIOS because the controlling programs are in the ROM on the adapter card. This gateway may have been intended to aid the migration of PC Network users to the Token-Ring, since the average size of a PC Network installation is fewer than 12 PCs.

## BRIDGING RINGS

Multiple rings can be bridged together via the IBM Token-Ring Network Bridge Program, which requires a dedicated AT with two Adapter II cards. Communications between PCs across the bridge are transparent to applications. The rings operate independently (each ring passes its own token), but work together as one logical ring. More than 72 devices (using type-3 wire) or more than 260 devices (using data-grade wire) can be interconnected.

The bridging program is not limited, as is the interconnect program. The PC LAN Program or any application can operate across one or more rings. The bridging function is performed using a superset of the 802.2 LLC functions: the IBM source routing technique mentioned previously.

A route is determined by broadcasting an XID (exchange identification) or TEST frame throughout the network. Bridge addresses accumulate in the frame as it passes around the network. Multiple responses may be received by the originating PC if more than one bridge exists between it and the destination PC. The originating PC must decide which route to use, typically the first response received. In general, a frame can be given one of four routing directives: broadcast to this ring segment, limited broadcast, general broadcast, or point-to-point routing.

The advantages of source routing are that the bridges do not need trans-

lation tables to function and do not have to make routing decisions; routing control becomes fully redundant by being distributed. However, when communicating across bridges, every frame will pick up overhead in the form of bridge addresses.

**Network Manager and NetView/PC.** Two significant announcements made by IBM this past September were the IBM Token-Ring Network Manager version 1.1 and NetView/PC.

The Network Manager actually should have been called version 2.0. By using Network Manager in conjunction with NetView/PC, IBM has strengthened what was a weak (even nonexistent) management link between the Token-Ring and SNA hosts. As a NetView/PC application, Network Manager provides automatic alert forwarding to a NetView host via an SDLC link. In addition, an operator at a remote stand-alone NetView/PC can dial up via an asynchronous link to a Token-Ring-attached NetView/PC and monitor or operate all of the Network Manager functions.

*Could NetView/PC mean the end of DOS? At a cost of \$2,000 per PC, NetView certainly will not be replacing DOS in the near future.*

Version 1.1 lives up to its billing as a manager; version 1.0 was more of a diagnostics program. Version 1.1 retains 1.0 features such as monitoring of the ring for hard (disruptive) and soft (intermittent) errors, logging of errors to disk or printer, and identification fault domains. Clearly, IBM wants to strengthen the SNA family by extending it to the PC. NetView/PC is actually a complete multitasking operating system for the IBM PC family. DOS merely runs as a task under NetView/PC.

NetView is an implementation of the service point in the newly announced IBM Open Communications Architecture. It is the base upon which device-dependent applications will be built to support the Token-Ring and Voice (ROLM CBX) networks. The Network Manager 1.1 is such an application, as is the new NetView/PC ROLM Call Detail Recorder.

Several facilities are available through NetView: The Alert Manager

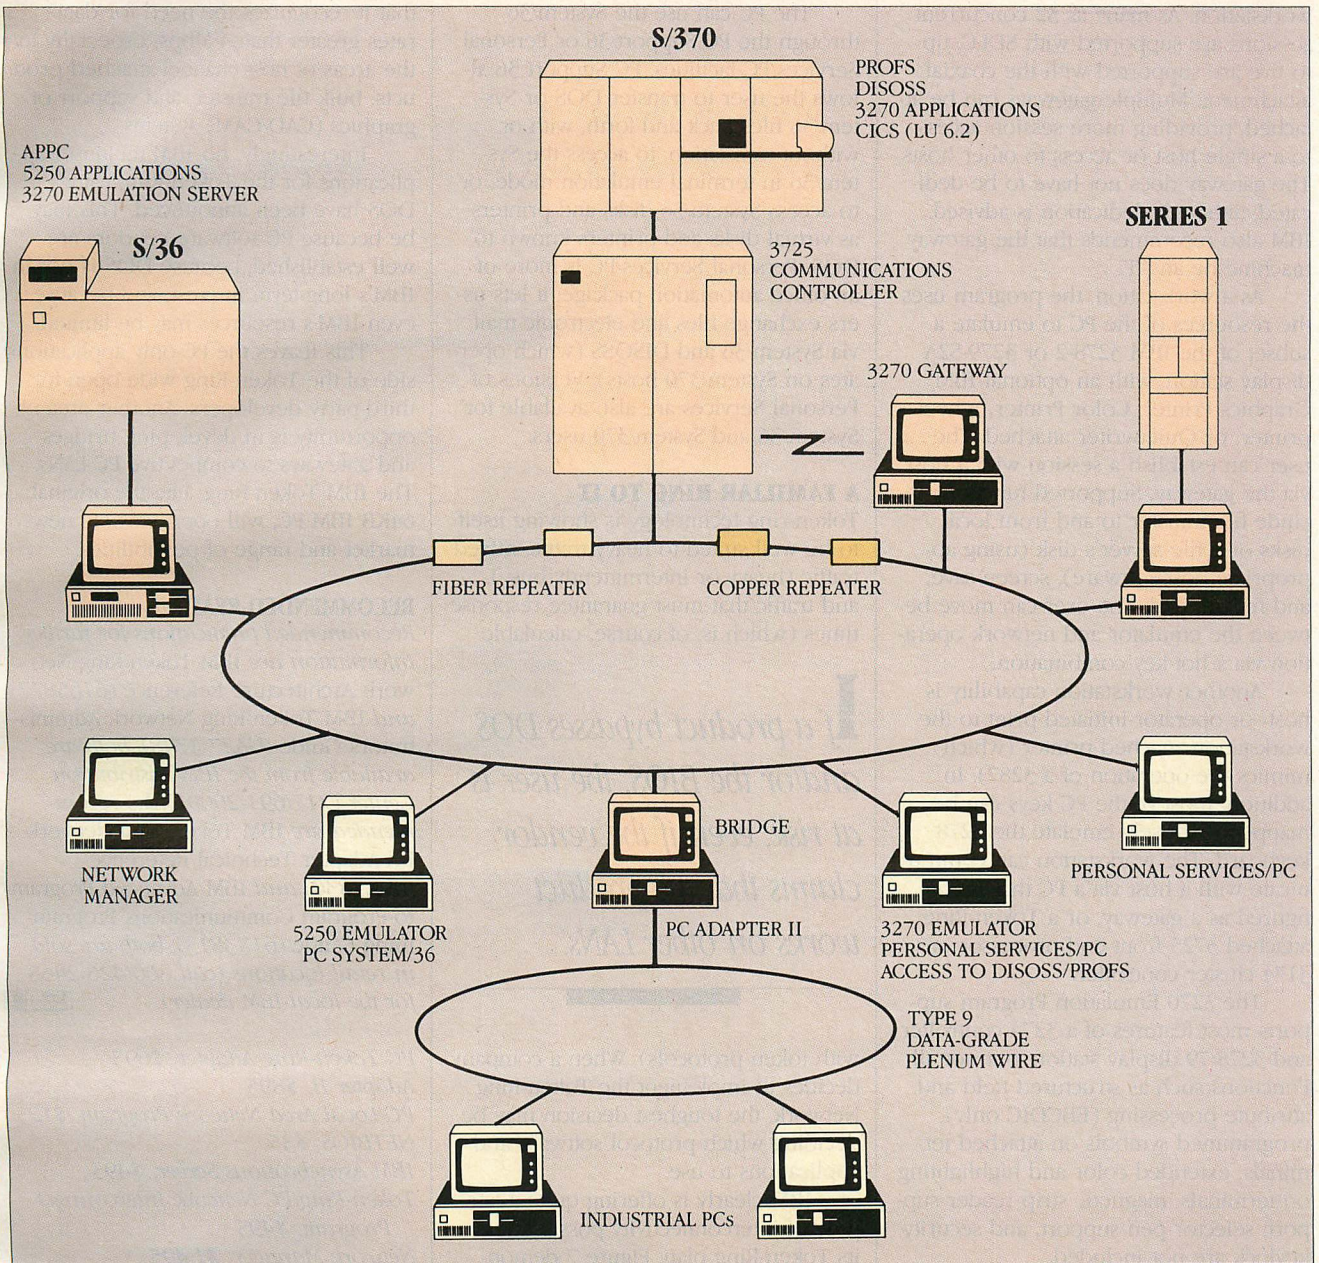

stores alert data with (optional) automatic sending to a NetView host. The Problem Manager permits a user to create, delete, or modify network problem information. The Service Reminder is an "alarm clock" that reminds operators to perform tasks such as network configuration changes and backing up PC file servers. The Remote Console Support allows remote operation of NetView/PC. The Communications Manager consists of APPC (LU 6.2) services, SNA PU services, and services required to communicate to remote devices over an RS-232 link (such as the ROLM Call Detail Recorder), either asynchronously or using SDLC. An Application Programming Interface/Communication Services (API/CS) interface also is included to develop device-dependent applications for operation with NetView/PC.

Could this be the end of DOS? At \$2,000 per PC for NetView/PC, the end will not come in the near future. True, the user gets a lot of SNA functionality for the money, but the vast majority of installed PCs (and clones) are not connected to SNA hosts. Eventually, however, it just may happen—a subset of NetView/PC could do away with DOS. **Third-party software.** Most third-party, multiuser software that was designed to operate with NETBIOS and/or DOS 3.1 or later will function properly in the Token-Ring under DOS 3.2. Beginning with DOS 3.0, IBM and Microsoft added extended functions to support byte-range locking within a file and new file-open modes to facilitate file sharing. These added functions are needed to support database-oriented applications and stand-alone applications (so they automatically lock files in use) in a network environment, but these functions are inadequate for developing servers and distributed applications. For example, DOS 3.x has no interprocess communications or semaphores, facilities that have been added to DOS 4.0.

Many popular software packages will not operate properly on the Token-Ring, or in some cases, on any LAN at all. In nearly every case, the problem lies with the software. A program may not be well behaved or perhaps was not developed with consideration of its use on a LAN. Lotus 1-2-3, for example, reads a spreadsheet file into memory, then closes it while the user is working on it, thus leaving the file at the mercy of other users. dBASE III, in theory, should work properly on the Token-Ring because it works with PC Network under the PC LAN Program and NETBIOS, as well as on Novell NetWare-based LANs. But it does not: dBASE

**FIGURE 7: IBM Token-Ring Attachments**

A variety of machines can be attached to the IBM Token-Ring Network. It also is possible to link several rings through a bridge.

III is not a well-behaved program, bypassing both DOS and the NETBIOS.

The first step is to make certain a multiuser application or development product (such as a database manager) uses the extended DOS file-sharing facilities. If it uses NETBIOS, it should be tested: the NETBIOS timing is different on PC Network than it is on the Token-Ring. If a product bypasses DOS and/or the BIOS, the user is at risk, even if the vendor says it works on other LANS such as NetWare, 3Com, or the IBM PC Network; it may not function properly on the Token-Ring. Users should look for vendor certification that the product

works on the Token-Ring; although these may not number many as yet, the field surely will increase in time.

#### **CONNECTING TO LARGER HOSTS**

Connectivity to larger IBM computing entities is one of the great draws for IBM PC networks. The easier this connection is made, the more likely a network will be successful.

**3270 Emulation Program.** This program provides users on the Token-Ring access to IBM hosts from their workstations, without the need for dedicated coaxial wiring and SDLC cards on each workstation that desires host communi-

cations. (For a discussion of 3270 emulation, see "Emulating the 3278," Roger Addelson, February 1986, p. 48.)

Because it was written originally for the PC Network, this program relies on NETBIOS for operation. It allows the PC to be operated in one of three modes: as a gateway on the network, as a workstation on the network, or as a stand-alone remote user station.

As a gateway on the network, the PC requires the IBM SDLC card (for remote 3274 operation) or IBM 3278/79 coaxial adapter board (for distribution function terminal, or DFT, operation) to communicate with the host. The gate-

way then serves users on the network who are running the program as a workstation. As many as 32 concurrent sessions are supported with SDLG; up to five are supported with the coaxial attachment. Multiple gateways can be attached, providing more session access to a single host or access to other hosts. The gateway does not have to be dedicated, although dedication is advised. IBM also recommends that the gateway machine be an AT.

As a workstation, the program uses the resources of the PC to emulate a subset of the IBM 3278-2 or 3279-S2A display station, with an optional IBM Graphics Printer, Color Printer, Wheelprinter, or Quietwriter attached. The user can establish a session with a host via the gateway. Supported functions include file transfer to and from local disks or a file server's disk (using appropriate host software), screen save, and file append. The user can move between the emulator and network operation via a hot-key combination.

Another workstation capability is host- or operator-initiated print to the workstation-attached printer (which mimics the operation of a 3287). In addition, most of the PC keys can be mapped to closely emulate the 3278 keyboard. The workstation can communicate with a host via a PC that is configured as a gateway, or a Token-Ring-attached 3725 front-end processor or 3174 cluster controller.

The 3270 Emulation Program supports most features of a 3274 controller and 3278/79 display station, but not all. Functions such as structured field and attribute processing (EBCDIC only), programmed symbols on attached terminals, extended color and highlighting on terminals, magnetic strip reader support, selector pen support, and security keylock are not included.

**System/36.** A System/36 model 5360 or 5362 can be attached to the Token-Ring using the IBM System/36 Local Area Network Attachment Feature with the System/36 PC 5360/5362 LAN Communications Licensed Program and the model 5364 with the System/36 PC 5364 Local Area Network Licensed Program. All models can connect to a maximum of two rings. The System/36 Token-Ring products are scheduled to be available in the second quarter of 1987.

The 5360/62 attachment consists of a direct-attach System/36-to-AT adapter installed in a dedicated AT that is connected to the Token-Ring via the Adapter II. For the 5364, also known as the System/36 PC, the AT is attached directly. In either configuration, a communi-

cations program is downloaded into the AT from the System/36.

The PC can use the System/36 through the PC Support/36 or Personal Services/PC facilities. PC Support 36 allows the user to transfer DOS or System/36 files back and forth, with or without translation, to access the System/36 in terminal emulation mode, or to access System/36 disks and printers as virtual disks and printers known to DOS. Personal Services/PC is more of an office automation package; it lets users exchange files and electronic mail via System/36 and DISOSS (which operates on System/370 hosts). Versions of Personal Services are also available for System/36 and System/370 users.

## A FAMILIAR RING TO IT

Token-ring technology is showing itself to be well suited to heavy traffic, mixed traffic (heavy or intermittently busy), and traffic that must guarantee response times (which is, of course, calculable

*If a product bypasses DOS and/or the BIOS, the user is at risk, even if the vendor claims that the product works on other LANs.*

with token protocols). When a company decides to implement the Token-Ring Network, the toughest decision may be deciding which protocol software and applications to use.

IBM clearly is offering quite a latitude of interconnectivity possibilities in its Token-Ring plan. Figure 7 demonstrates some of these connections. At the same time, it is allowing for great flexibility among third-party vendors in developing products. Thus, the end user can have the best of both worlds.

While the Token-Ring already boasts a great deal of integrity (via MAU operation and recovery features of the 802.5 protocols), IBM has begun to fill the need for diagnostics and management tools (a missing element of many PC LANs) via the Network Manager and NetView/PC programs. Future IBM products will provide more management capabilities to control the operation of other rings from a single location.

Interconnectivity will increase with channel-attached host and ROLM CBX connections. IBM has guaranteed

16-Mbps performance on installed Token-Ring data-grade wire, and has stated that it recognizes the need for data rates greater than 4-Mbps, especially in the areas of host channel-attached products, bulk file transfer, and support of graphics (CAD/CAM) systems.

Interestingly, no IBM multiuser applications for the Token-Ring using DOS have been announced. This may be because PC software vendors are well established, because DOS is not in IBM's long-term interest, and because even IBM's resources may be limited.

This leaves the PC-only applications side of the Token-Ring wide open for third-party developers. Another area of opportunity is in developing bridges and gateways to competitive PC LANs. The IBM Token-Ring, like the original 64KB IBM PC, will open a whole new market and range of possibilities.

## RECOMMENDED READING

*Recommended publications for further information are IBM Token-Ring Network Architecture Reference (6165877) and IBM Token-Ring Network Administrators Guide (GA27-3748); both are available from the IBM Distribution Center (717/691-2000). Also recommended are IBM Token-Ring Network PC Adapter Technical Reference (69X7830) and IBM Advanced Program-to-Program Communications Programming Guide (61X3813); both are sold in retail locations (call 800/426-2468 for the local IBM dealer).*

# PC BRAND: CAREFULLY CHOSEN PROGRAMMER TOOLS

## BRIEF Is Anything But. A Whopper of an Editor

With a name that belies its thoroughness, Brief™ has every feature you've ever contemplated for your editor-in-chief. Text, from keyboard or files, is housed in multiple buffers, and scrolled through one or more windows you open, close, resize. A text buffer may be called to different windows to view two areas at once. A change in one changes both. Text blocks may be marked for printing, writing to files, movement to scrap buffers for cut and paste into other buffers, or deletion, with as many "undo" levels as you want.

Brief has text search abilities rivaling "grep", with wildcards for matching, indifference to intervening characters, acceptance of character ranges.

If you use Lattice, C86™, or Wizard, and have 320k, you can compile your C program without ever leaving Brief. It finds the lines with errors, and marches you through the text for repairs.

Parts of Brief were written with its own Lisp-like macro language which has structure, 32-character variable names, conditional execution, loops, and you can actually read it! Nothing like the hieroglyphs we've seen elsewhere. Bulletin board and public domain disks with macros: "Simply the best text editor you can buy", Dvorak Infoworld, (Needs 192k.)

Ask for: List: PC Brand:  
U0690 \$195 Call

## HALO GRAPHICS SYSTEM Multi-Board Graphics Library

The premier graphics library that got the ball rolling for PC-based graphics and has grown so omnipotent that it supports over 25 graphics boards — including IBM's EGA and Nt. 9 Revolution's hi-res series — and has a multitude of mouse and printer drivers. All that in each box. Separate C versions for Lattice, Msoft, Aztec, C186. What does Multi-Halo do? A down to the last pixel graphics library plus functions to reset drivers so distributed program can run on anything. Wonderful value for single license. Flexible licensing available for redistribution. Specify: S0315 & Language. List: \$300. We: \$219. With Dr. Halo II, a free-standing "paint". List: \$440, Us: \$299.

## dBC Lattice Library Maintains dBASE Compatible Files With the Power and Speed of C

dBC™ links C to dBASE. It creates and maintains files and their indexes which exactly replicate dBASE file design. So dBASE can read and update them. And the reverse. dBC can use any files created by dBASE. Now C and dBASE can operate on the same data bases interchangeably.

That opens up the widespread culture of dBASE installations to exploitation by C programmers. Tap that market, avoid the resident dBASE language, and gain the advantages of C with this single product.

dBC's functions parallel all dBASE's file handling commands, many decomposed to give closer control. Each backed by demo source files on disk.

## WINDOWS for C/WINDOWS for DATA Microsoft Windows™ and TopView™ Compatible

Windows for C™ is a library of over 80 functions to add the pizzazz and practicality of window partitioning to your application. Unlimited windows, each defined in a C structure for easy reference throughout your program, can be made either to pop up or permanently overwrite the screen. Routines will scroll and highlight lists with arrow keys, will read and scroll ASCII files vertically and horizontally in windows, and even write to memory-loaded files off the screen.

Logical treatment of video attributes permits unchanged programs to run on color or monochrome. Colors of windows are set individually.

All functions are in separate modules; only those used are linked. Only buffers holding on-screen or temporarily obscured windows occupy RAM; others released dynamically. Best overall rating and fastest display in Bill Hunt's 7/88 Tech Journal review of five windowing products.

Windows for Data comprises all of Windows for C but takes in data through the windows as well. At the high level a single function lets you specify prompt string, field length, data type, screen location, picture, target variable, then sets lesser functions scurrying to get and process a user's input. There are utilities to get system date and time, mess with strings, create your own masks for fields.

Field options can require entry, prevent entry, permit insert or overwrite, beeping on invalid or overflow keystrokes, and attachment of field-specific help messages

## C-TREE B-Tree File Manager, Source Code, No Royalties!

C-tree is sturdy code that has weathered many seasons of prolonged and widespread use. It comes in C source, so you can modify it to fit a special case. No royalties provided you bind it into your binary application.

C-tree's design splits nodes to allow any number of users to access an index file simultaneously even when updates are in progress. So multi-user configurations and adaptation to networks are possible. Record-locking routines are provided for

Use dBC for custom work for clients, or on its own. It's a complete ISAM file manager for C whether or not dBASE will be used in tandem, supports all four memory models, and can have sixteen index and data files open. Big discount to buyers of both dBASE II and III versions. Specify Lattice, Microsoft 3.x, or DeSmet.

Versions: List: PC Brand:  
L0011 For dBASE II \$250 \$195  
LCC11 With Source \$500 \$390  
L0111 For dBASE III \$250 \$195  
LC111 With Source \$500 \$390

### CALL FOR FREE DEMO!

and functions you want called to display messages or validate entries. And you decide which keys will clear a field, jump to the next or prior, quit, etc. Options diverse enough that a set of "fields" can be made to behave like a Lotus™ menu.

Specify Compiler: List: PC Brand:  
T0100 Windows for C \$195 \$149  
T0150 Windows for Data \$295 \$259

## MICROSOFT C 4.0 A Great C Battle Rages and You're Winning

As the dreadnaughts pound each other with ever heavier ordnance, today's programmers reap the spoils of this war. Bundling a source debugger and a "make", and sporting a "huge" memory model permitting single data objects larger than 64k, the Microsoft C compiler has jumped a full version number to 4.0. But what's really impressive are the benchmarks reported in Dr. Dobbs's (8/88) encyclopaedic survey of 17 C compilers. Microsoft's and IBM's C (licensed from Microsoft) run away with the contest winning 11 of 27 benchmarks.

The CodeView™ debugger, free for a limited time, uses windows to show everything on one screen: source alongside disassembled object, variables, stack and registers. Drop down windows—use a mouse if you like—obviate learning of commands. "A source-level debugger that puts the rest

## 30-DAY MONEY-BACK GUARANTEE

We refund the purchase price of any product returned within 30 days in entirely resalable condition. You can even try out programs themselves if product code begins with E, T, or L through N — even if it means breaking the disk seal. Some developers do pose limits, so for products beginning with other letters, opening sealed disks constitutes acceptance. But you can at least stop the manual. There's just nothing stopping your buying from PC Brand.

to shame" (Dobbs).

Microsoft C now has five memory models for code and data, plus non-library support for another thirteen, and boasts alternate math packages for speed versus accuracy, with or without 8087/80287 chips. A big plus in multi-language settings: call from this C any routine written in later versions of M'soft Pascal, FORTRAN, or Macro Assembler. Object code of all four may be intermixed come link time or commingled into libraries.

Both linker and library manager are part of the package, as is the "make", a UNIX™ name for a smart batch program which knows to expend minimum effort to rebuild any size of project by compiling and assembling only elements affected by new or changed modules.

It is reportedly used by Lotus, Ashton-Tate and, fittingly, Microsoft itself to develop Windows. Dobbs calls it "the best MS-DOS C development environment value today [for] virtually any kind of program conceivable." 320k suggested.

Ask for: List: PC Brand:  
G0500 \$450 \$295

## CURSES Unix Style Screen Management

Curses from Lattice™ manages the screen of the PC like Unix™ curses. Library of 84 functions and macros parallels Unix with matching parameter lists. So Unix programs are at home on the PC, and vice versa. Keeps any number of screens in memory, supports color, vast function set to get characters, wrap lines, scroll, blank lines, highlight, etc. Like Unix refreshes screen only on your command. Ask for: L0860. List: \$125. Here: \$99. With Source: L0860, \$250/\$199

## PANEL Feature-Laden Screen Design Tool

Writing your own screenware can blow completion dates and profits. Panel™ works with you interactively to set up foolproof screen displays and data entry forms rapidly. Output is C source code.

Not just single plane: layer your screen designs with up to ten overlapping images: Background pop-up lists, help boxes, and alternate input fields.

Panel builds in a user interface for keystroke movement within and between fields, supplies validation routines for

checking user field entries. Diverse attributes may be selected for any field — size, data type, color, conversion of input to upper case; clearance of existing data when new entry is started; masks for standard formats (eg. dates); phrases which fill in when their first letter is typed; multiple-choice lists from which to choose by cursing a highlighted bar. Fields may be multi-lined and scrolled if larger than the screen space allotted them. Specify: S0400 & Compiler. List: \$295, Us: \$229

**WHY US?** Latest versions of all products • Everything listed is in stock • Shipped 24 hours or sooner • No surcharge for credit card or COD purchase. **NEED TERMS?** On-the-spot credit to most public companies, government, educational, medical institutions. **LOOKING FOR SOMETHING?** We can get many more products — just ask! **NEED MORE INFO?** Our Catalog and literature cover just about everything.

# TODAY'S TOP QUALITY AIDS TO PROGRAMMING PRODUCTIVITY

## GREENLEAF Bountiful Harvest FUNCTIONS

C source, assembler source, and binary libraries of 225 functions for many compilers. Emphasizes tight functional groupings to minimize loading code which your application may never use. Manual helps select functions, bulletin board, too.

A sampling: *DOS* extensions for file and directory manipulation; *Screen*: to select mode, page, monochrome or color, palette; cursor shape, positioning; clearing and scrolling; pixel get and put; read light pen. *Strings*: Center, justify, etc.; efficient list operations which add, delete, sort string pointers for top speed. *Other*: graphics character primitives, keyboard status, function key assignment, time/date, read registers and memory size, peek and poke. Mature best-seller. Specify: S0770 & Compiler. List: \$185, Here: \$139

## PFORCE Phoenix Pfunction Festival

Lotus® didn't do badly pulling it all together in one place. Phoenix has followed suit with the ultimate integrated C library, offering everything from low level functions for hardware access to complete b-tree database management. Along the way are prerequisites such as string manipulation, time/date, field and screen editing, but also four styles of menus (Lotus included), windowing, background tasking, DOS interfaces, directory management, even interrupt-driven communications. Design emphasizes objects, so characteristics of windows, databases, records and fields can be initiated and changed outside functions.

One large collection in place of bits and pieces means one set of instructions and PforCe™ has tutorials, extensive examples, quick reference, and on-line help.

Everything in source, no royalties, all memory models of Lattice, Msoft. Specify: S0220 & Compiler. List: \$475, PCB: \$349

## GREENLEAF Hello World COMMUNICATIONS

Want your application to communicate with other users or remote date bases by asynchronous communications built right into your C programs! Even if you don't need it now, that's a skill to have at the ready!

120 functions and demo programs in both C and assembler source code set up separate transmit and receive ring buffers for up to 16 simultaneous channels. Interrupt driven so you can halt an incoming record, display it, file it, let the user edit it, then continue. Goodbye separate communications software.

Supports up to 9600 baud, ASCII or binary, any parity or word length, 8250 UARTs, Xon/Xoff and Xmodem, WideTrack receive. Specify: S0750 & Compiler. List: \$185, Us: \$139

## PRE-C PRICE SLASHED! Pick the Lint from Your Program

Pre-C is like UNIX's lint. It finds problems your compiler won't. Problems that a debugger will have trouble figuring out. Even problems which will cause trouble with other compilers.

Compilers see one module at a time. Modules only meet at link time. Pre-C looks at all modules at once and reports conflicts in data type declarations; function call parameters which disagree with functions, machine-dependent expressions which inhibit portability. It spots obsolete usage (even C changes), casts with suspect conversions, variables never used, functions never called, unreachable code. Adheres to UNIX System III compile standard to ensure your portability. Ask for: P0590, List: \$295, Ours: \$208

## DAN BRICKLIN'S DEMO PROGRAM Storyboard Your Program

The Legendary One has created Metaphor Two when the rest of us are still on Zero. Dan's first was the original electronic spreadsheet (VisiCalc™). This one is for programmers.

Words don't express program ideas because programs are screens! Dan's Demo creates slide shows. Create a screen — a snapshot of your planned product as it runs. Anything goes: words, borders, box rules, inverse and underlining of monochrome, fore- and background color. Copy this "slide" to an empty screen. Change it a little, to show the next instant of run-time. Do it again. Presto, a whole slide show of your program in action.

All 250 characters and attributes are available from scrollable lists which pop to the screen. All commands are layered in Lotus-style pop-up menus. Frequent choices mapped to function keys as well.

80x25 character mode, not bit-mapped.

Screen areas can be blocked for cut and paste or filled with color or characters, even blink. Slides can overlay on others, can be shuffled, deleted. Slides can proceed at time intervals or branch anywhere in the slide sequence depending on user keyhits.

Invaluable to prototype the program you are about to write, to position the labels, choose the color decor, smooth out the keystroke interface. Or load the "capture" utility and snapshot the screens of any running program for an instant slide show.

Each copy entitles you to redistribute fifty of the slide projector program that runs demos. Plain manual, no binder keeps price of big product small. "Might... become the essential tool in... user interface prototyping," *Tech Journal*. Ask for: N0100, List: \$75, Us: \$69

## BASTOC OPTIMIZES! Translates BASIC Into C

For a trifling price, BASTOC™ moves truckloads of BASIC code over to C. It's a translator which takes in Microsoft Extended BASIC and emits pure K&R C for Lattice 3.0. It will optionally convert your program into a single monolithic C function or decompose it into separate functions, one for each GOSUB label.

Version 2's optimization dramatically reduces execution time. Converts to integers those variables in BASIC programs which do not need floating point. Where BASIC uses full assignment statements to increment counters, BASTOC converts to C's compact form. Strings dynamically allocated nidding your application of BASIC's catenatic halts for garbage collection. Creates structure of even convoluted BASIC code. Huge work saver.

Ask for: List: PC Brand: S0375 \$495 \$399

# PRICED TO SAVE YOU MONEY, BEST SHIPPED FAST ANYWHERE. BEST PRICES YET!

## RYAN-McFARLAND FORTRAN

*A Mighty Fortress Is Their FORTRAN*

NEW!

Picking over features of rival products is not necessary if FORTRAN is your need, still the citadel of scientific and engineering work. Ryan-McFarland has left the competition battering at the gates.

RM/FORTRAN™ is a complete implementation of FORTRAN-77 (ANSI X3.9-1978), the only PC FORTRAN certified by the General Services Administration at the highest test level. The reason: it's a big mainframe compiler moved to PCs, with the bonus that mainframe and mini applications can wander between

environments.

Now, on your PC, you can develop large applications, with programs up to 640k (bigger using overlays), arrays over 64k, and using a long list of VS, VAX and FORTRAN-66 extensions you may have grown fond of — long symbolic names, "include", IRT bit functions — because R-M has left out nothing.

But what really sets RM/FORTRAN apart is optimization. The compiler reduces the number of instructions to the minimum which will actually execute, and even takes advantage of each processor's features to deliver lightning-fast object code. It runs 30%-40% faster than Microsoft 3.2, and could make your mainframe not worth the trouble.

Comes with an interactive symbolic debugger like that accompanying IBM VS FORTRAN, Plink86 subset, has a cross reference compile option, supports assembler and C subroutine calls, IEEE floating point, 8087 and 80287 chips.

"Compiler's documentation, ease of use, speed of execution, and debugger facilities place it first for recommendation" said the *Tech Journal* (10/85).

R-M has been writing FORTRAN compilers for IBM, DEC, etc. for 20 years. There is no greater expert.

## RUN/C PRO

*C Interpreter Links Binary Libraries*

Run/C comes in an apprentice and pro version. The professional model dynamically loads and unloads multiple binary function libraries like C-Food Smorgasbord™ and Halo Graphics™ — potentially any library compiled with Lattice's large model. Inside this interpreter your C program can reach for functions in the best of commercial libraries.

This C interpreter behaves like PC BASIC meets WordStar®. Use fullscreen editing to create a program. RUN it. If it stumbles, LIST it, EDIT it, RUN it again, fix it again. Use familiar commands like LOAD, MERGE, SAVE, FILES, even TRON and TRACE.

Ideal for program development. Put up code at high speed, try out things devil-may-care, let RUN/C find your malaprops. Blast away until tight little code segments are undyingly faithful.

Lots more features: system interrupts, a shell command to invoke any operating system command without leaving Run/C, debugging aids ingeniously installed as a Run/C function. Call for debugging conditionally from within your program, a specific function or a menu of aids including immediate mode, single-step tracing, changing of variable values.

Manual shows how to develop the interface to a commercial library, using the Lattice compiler (a must). Link your own function archive the same way. (320k minimum; 512k recommended to fit libraries.)

Ask for: S0950 List: \$250 PCB: \$185

## PLINK86 PLUS

*Cached Overlays Maximize Memory Use*

Long the overlord of overlay linkers, Plink86 shoehorns large programs into small machines by swapping program segments in from disk to save memory. A 512k program could run in a 128k machine, for example. But Plink86 Plus is smarter still: if it finds itself in a larger machine, it moves program overlays into leftover memory. Overlays now swap at memory speed not disk speed. Can automatically restore a displaced overlay to which a subsequently called overlay must now return, and assign library modules to the root segment or overlay areas. Plink86-Plus: List: \$495. Us: \$359.

## LATTICE C COMPILER

*Major Upgrades to the Best Selling C Compiler*

Lattice now embraces key UNIX™ enhancements which have entered the language since K&R: void functions returning no value, enumerated data types to assign stepped values to variables, data passing between structures by assignment.

The greatly expanded libraries (325 functions!) enable the file sharing and record locking provisions of DOS 3.1, provide a full complement of transcendental, and a host of utilities to mimic the UNIX and XENIX™ environments.

Lattice 3.0 defaults to the ANSI proposed standard when you need strict adherence, but command line options restore leniency. And it adopts ANSI checking of external function arguments by data type to kill bug swarms when modules join up at link time.

Lattice now delivers smaller .EXE files, boasts very fast link times and a more efficient aliasing algorithm. New options generate code to use 80186 and 80286 features; 8087 of course sensed and utilized. Lattice has enjoyed pre-eminence so long that developers have created far more snap-on tools for Lattice C than any other compiler. William Hunt's *PC Tech Journal* review of 12 compilers awarded Lattice the only "very good" rating for add-on library availability.

## BETTER BASIC

*Convert Microsoft BASIC. Structured, Compilable.*

Combines the familiarity of BASIC with the best features of C, Pascal, and Modula 2, yet BetterBASIC is 100% compatible with Microsoft's GW™ BASIC and IBM BASICA including graphics, sound, and assembly language calls. So load your old programs and RUN. SAVE and they are converted automatically to BetterBASIC!

It's big: Needs 192k; programs can go to the PC's full 640k. It's comfy: Behaves like M'soft BASIC at the interactive level, with a full-screen editor, direct statement execution, and always poised to RUN. It's fast: Each statement checked and compiled once, not every time encountered. Sieve runs 6 times faster than with M'soft.

C-like structures house file records so goodbye to FIELD, MKII, CVD, LSET, etc. Named "procedures" replace GOSUBs to linenumbers. Lots more features: built-in linker for compiled modules; trace; debug; breakpoints; cross-reference command; 32k strings; DOS and BIOS calls and interrupts; recursion. Run-time module stores object code for redistribution.

## GSS GRAPHICS SYSTEM

*Leave the Device Driving to GSS*

ANSI CGI STANDARD!  
PRICES CUT!

GSS™ has reconfigured two components of its comprehensive graphics tools to conform with the ANSI Computer Graphics Interface (CGI) standard.

At the heart of the system is the Development Toolkit which contains all language interfaces and device drivers for keyboards, mice, joysticks, tablets, printers, plotters, cameras, and more. Drivers house management of vector graphics (plotters) and bitmaps used by raster input devices (scanners) to insulate the application program from concern for device idiosyncrasy. No one else has implemented CGI that way. It means your programming remains generic; just switch drivers and the same program will drive a different device.

GSS Kernel™ conforms to level 2b of ANSI's Graphical Kernel System (GKS) and contains all its needed drivers and language bindings. Kernel has macro level tools to draw and color an object, store the sequential instructions, and recreate the object on its own, as well as segment it, transform it, etc. So powerful, a single command may represent several score lower level statements.

Plotting has the equivalent GKS tools for graph and chart generation and their captioning: hand it apples and oranges, say "pie", and it bakes the numbers into a digestible display for screen or plotters.

Kernel and Plotting have tools to convert images they create to ANSI Computer Graphics Metafiles (CGMs), a tokenized standard for storing every form of graphic image as data. The Metafile Interpreter

reads the contents of a CGM and interprets it with full CGI capability for recreation on various devices.

Quality software? IBM thinks so. They sell the GSS series under their own label.

Unit royalties and annual fees have been instituted for redistribution. Needs 256k.

## BTRIEVE

*Queen B-tree File Manager Abdicates Royalties*

ASK ABOUT XTREIVE & RTREIVE

There's no longer a tithe to incorporate Btrieve™ in applications, a welcome proclamation if royalties would ruin your profit margins. Btrieve takes complete charge of all file creation, indexing, reading, writing, insertion, deletion, space recapture, forward and backward searching. It builds function call "commands" right into the language you use: interfaces to C, Pascal, BASIC, and COBOL, with sample programs in all four, come with each copy.

Btrieve has mainframe specifications! Its balanced-tree indexing scheme finds any key in a million in four or less accesses. Files may have up to 24 indexes; fixed record length to 4090 characters; indexes up to 255 characters; files of 4 billion bytes.

Can even extend a file across two drives — even two hard disks!

Version 4.x speeds DOS interaction for large multiply-keyed files; enables variable length records of virtually any length; verifies accuracy (optionally) with read after write, useful in gritty environments; offers password and data encryption.

There's also Xtrieve, for Btrieve file inquiry and data manipulation, and Rtrieve for report writing. All three in versions for any network that supports the MS-DOS 3.1 file sharing function.

IBM's new 2,400 bps PC Modems  
give you an easy choice:

# Either

Stand-alone.  
The IBM 5842  
2,400 bps Modem.

Either way, you can't go wrong.

With IBM's new modems and a personal computer you can tap into information at a very impressive 2,400 bits per second (bps).

That translates into a binary file transfer speed of nearly 13 K characters per minute—or over six pages worth. Now imagine the impact that can have on your long distance telephone bill.

But these new modems aren't just fast, they're also versatile. They can both send and receive data asynchronously at speeds ranging from 2,400 bps down to 75 bps.

Both modems are compatible with the popular "AT" command set, as well as the IBM command set. And they have been tested for compatibility with leading PC communications software such as Crosstalk™ XVI, Microsoft® Access, Kermit, Smartcom® and Smartcom II®.

# Or

## The Automatic Modems

These modems feature Automatic Adaptive Equalization at 2,400 and 1,200 bps—which means they will continuously fine-tune themselves to compensate for changes and noises on the telephone line. The result is, you can receive data over a wider range of telephone line conditions.

Both modems also feature automatic or manual answering and dialing. They'll automatically switch to pulse dialing if tone dialing doesn't work. They have automatic redialing. And once a connection is made, automatic speed detection. They also have automatic detection of a voice or a failed call.

### A Modem with a Memory of Its Own

The stand-alone IBM 5842 2,400 bps Modem offers some additional features. It can also send and receive data synchronously at speeds of 2,400 bps or 1,200 bps. You'll find extensive "Help" menus. A dial directory for 20 phone numbers. A log-on directory for five log-on sequences. A built-in pattern generator for self testing. Diagnostics implemented from the front panel as well as from the computer keyboard. And a complete array of LED Status Indicators to give you a quick visual check on what's happening.

**Internal.**  
The IBM  
Personal Computer  
2,400 bps Modem.

## Which One Is for You?

The internal IBM Personal Computer 2,400 bps Modem is designed to occupy a half slot in the IBM PC, XT, AT and 3270 PC.

The stand-alone IBM 5842 2,400 bps Modem is compatible with all models of IBM Personal Computers. And, in addition to the features mentioned above and its internal power supply, the significant difference is that a stand-alone modem can be moved from PC to PC more easily than an internal modem.

If you feel that 2,400 bps is more modem than you need, we also offer the stand-alone IBM 5841 1,200 bps Modem, and the internal IBM Personal Computer 1,200 bps Modem.

For the Authorized IBM PC Dealer nearest you—or for free literature on the IBM family of PC Modems—call 1 800 IBM-2468, Ext. 936/EM. Or you can contact your IBM marketing representative.

# Mass-Storage Mergers

*Hard disks mounted on cards give PC users the increased capabilities of a hard disk without having to sacrifice a diskette drive bay.*

PETER G. AITKEN

As applications and software development systems increase in power and size, more and more of them cannot be used without a hard disk. A number of software packages can be run, in theory, from diskettes, but only with a maddening amount of disk shuffling. A hard disk, whether as original equipment or as an add-on, has become an almost essential part of any PC system intended for serious business or technical applications.

Some owners of dual-diskette PCs are hesitant to upgrade with a standard internal hard disk, even when the cost of the disk is not an obstacle. Recognizing this hesitation, several vendors have introduced *hard-disk cards*, which integrate a Winchester disk and controller on a single expansion board. These products overcome some of the drawbacks of a standard internal hard disk.

A standard hard disk must be mounted in one of the diskette drive bays; this requires either removal of one diskette drive or the added expense of purchasing one or two half-height diskette drives. Furthermore, standard internal hard disks almost always require more power than can be provided by the PC's original 63.5-watt power supply, necessitating a power supply replacement. Installing the hard disk and the replacement power supply may seem to be a forbidding task even to users who would not hesitate to install a memory expansion card.

These problems were first addressed by Plus Development Corporation's Hardcard, introduced 18 months ago; it combined controller circuitry and a low power 10MB hard disk on an expansion card. The 10MB Hardcard was selected as *PC Tech Journal's* Prod-

**FIGURE 1:** *Form Factors of Hard-disk Cards*

Careful study of the way a disk product uses bus space in addition to how much it uses can lead to a board mix that wastes few if any slot resources. The slots are shown at the PC/XT spacing of 0.8125 inch; each connector is 3.375 inches long.

PHOTOGRAPH • BLAKESLEE LANE

These 11 cards offer several options for upgrading to a hard disk. They are (from top to bottom) left column: Microscience Easycard 20, Express Systems Hard Card 2060, Express Systems Hard Card 6060, and PC's Limited 20 Meg; middle column: Qubié Hardpack 20, Western Digital FileCard 20, and Plus Development Hardcard 20; right column: PC Source Flashcard, Mountain Computer Drivecard 20, Mountain Computer Drivecard 30, and CMS Drive Plus 21.

uct of the Month in February 1986 (p. 31) and was reviewed in the same issue ("Storage on a Card," Thomas V. Hoffman, p. 139).

Since then, hard-disk cards have been proliferating, with the most recent crop featuring 20MB (or more) of storage. This article examines eleven hard-disk card products: nine with 20MB of storage—CMS Drive Plus 20, Express Systems' Hard Card 2060, Microscience's Easycard, Mountain Computer's Drivecard 20, PC Source's Flashcard, PC's Limited 20 Meg, Plus Development's Hardcard 20, Qubié's Hardpack 20, and Western Digital's FileCard 20; one with 30MB—Mountain Computer's Drivecard 30; and one with an impressive 60MB—Express Systems' Hard Card 6060. The features of each card are summarized in table 1.

Because these cards occupy valuable space in the PC's slots, their size is an important consideration. Some of the cards require only one full slot, either by virtue of their thinness or because mounting them in an end slot allows their extra bulk to protrude beyond the card area where they do not block an adjacent slot. Others require 1½ slots allowing a half-length

card to be mounted next to them. Only the Express Systems 60-MB unit with two separate drives on one card occupies two full slots. Physical configurations for all of the hard-disk cards are diagrammed in figure 1.

### CODING METHODS

Hard disks operate by recording magnetic information on the surfaces of the spinning platters. Before any data are recorded, all of the magnetic particles in the platter coating are aligned the same way. During the write process, electric currents in the read-write head induce flux reversals, or changes in magnetic orientation, in the magnetic particles. During the read process, these flux reversals can induce minute electric currents in the read-write head. The design of the read-write head imposes limitations on the minimum and maximum spacing of flux reversals; if they are too far apart or too close together, they cannot be read reliably. In most systems, the presence of a flux reversal represents a binary 1 and the absence of a reversal represents a binary 0. Before being recorded, digital data must be encoded to prevent flux reversals from being spaced too far apart, as

might happen in recording a long string of binary 0s.

An early method of encoding digital data for hard-disk storage was *frequency modulation* (FM). Because this coding method required one clock bit for every data bit, the effective data recording density was only 50 percent.

*Modified frequency modulation* (MFM) is now the most common coding method and is used in most of the products in this review. MFM does not record one clock bit for each data bit, but uses the incoming data stream to generate the clock signal in the controller. An extra flux reversal is inserted between consecutive 0s to prevent flux reversals from being spaced too far apart. Compared to FM, MFM adds many fewer extra bits to the data, allowing for a significantly higher effective recording density.

*Run length limited* (RLL) is a newer coding method used by some of the reviewed hard-disk cards. RLL translates the incoming data into a special digital code in which the number of 0s in sequence, the run length, is tightly controlled. In the most common RLL scheme, RLL 2,7, the number of 0s in sequence varies between 2 and 7. RLL

## HARD-DISK CARDS

2,7 requires more bits than MFM to encode a given amount of data, but because each digital 1 (signaled by a flux reversal) is always followed by at least two 0s (absence of flux reversal), the RLL encoding method permits the frequency of the data stream to be increased significantly. RLL 2,7 requires a more complex, costly controller, but typically permits a 50-percent increase in effective recording density over MFM. A disk holding 20MB when attached to an MFM controller can hold 30MB with an RLL 2,7 controller.

### DOS COMPATIBILITY

While all of the hard-disk cards in this review work with DOS 2.x, version 3.x performs more reliably and efficiently. The FORMAT.COM program provided with DOS 2.x does not reliably format 20MB (or larger) disks because it cannot accurately map bad tracks above 16MB. Some products get around this problem by providing their own formatting program, either as part of an automated installation routine or as a stand-alone program to be used instead of FORMAT.COM.

DOS 3.x is more efficient at using disk space; it uses a 2,048-byte cluster size rather than the 8,192-byte size used by DOS 2.x. Note that three of the cards in this review (the two Express Systems hard-disk cards and the PC Source Flashcard) come from the factory preformatted with 8,192-byte clusters. Even if DOS 3.x is installed on these cards, the card must be reformatted with the 3.x format program to get the benefit of the smaller cluster size.

Early versions of IBM PCs, Compaq Portables, and AT&T PC6300s may have versions of the ROM BIOS that do not recognize a hard disk. This prevents not only booting from the hard disk, but also any access to it at all. The following BASIC program checks the BIOS version of an IBM PC:

```
10 DEF SEG=&HF000
20 FOR X=&HFFF5 TO &HFFFC
30 PRINT CHR$(PEEK(X));
40 NEXT
```

A date is displayed; if it is earlier than 10/27/82, this is the nonhard-disk BIOS.

For a Compaq portable, this BASIC program should be run:

```
10 DEF SEG=&HF000
20 PRINT CHR$(PEEK(&HFFE6));
```

If the letter A or B is displayed, the computer has the nonhard-disk BIOS.

For the AT&T computer, the bottom panel must be removed and the revision number on the ROM BIOS chip

determined; a revision number less than 1.1 indicates a nonhard-disk BIOS.

Some of the cards include a software patch that allows an early BIOS computer to recognize a hard disk. The computer must be booted from a diskette and the software patch run, after which the hard disk can be accessed. These software patches work only with DOS 2.0 and 2.1; and they do not permit booting from the hard disk.

### INSTALLATION PROCEDURES

For this review, each hard-disk card was installed in a PC with a 135-watt power supply and two adjacent empty slots in order to assure adequate power and space for each card. The manufacturers' instructions for physically installing the cards ranged from excellent to nonexistent. For those cards that get all of their power from the PC's bus, the installation procedure is no different from installing a memory or other expansion card. Some hard-disk cards contain disk drives that require a separate connection directly to the power supply. Because most PCs are not equipped with a spare power supply lead, a Y adapter is needed to allow one power supply lead to serve as two. Most of the disks that require a separate power supply connection provide a Y adapter for use if the power supply itself does not provide a spare lead.

Once the hard-disk card was installed in the computer, the manufacturer's formatting and software installation instructions were carried out exactly as

written using PC-DOS 3.1. All of the tested products, with the exception of the PC's Limited 20 Meg, come with low-level formatting already done; some also have high-level formatting done. Some of the disks come with a more-or-less automated installation program, while others require use of DOS programs FDISK and FORMAT. In all cases, following the manufacturer's installation instructions resulted in a bootable, working disk.

Following the installation, the card's logical specifications were determined by using a utility program called INFO (from the article "Finding Disk Parameters", Glenn F. Roberts, May 1986, p. 112). This information, along with weight, power consumption, and other data, is summarized in table 2.

An important consideration when installing hard-disk cards is the cooling system. These cards generate a significant amount of heat, considerably more than other expansion cards. They must receive an adequate supply of cooling air. Adjacent cards must not touch each other, and cables should be routed to minimize their interference with air flow. For early PCs a minor, IBM-approved modification is recommended to increase the supply of air to the expansion cards. A row of ventilation holes extending across the entire width of the front of the computer (the system cover must be removed to see them) should be blocked to force more of the cooling air to pass over the expansion cards. A piece of plastic tape

Because their drive mechanisms are mounted at the bus ends of their cards, the Qubié Hardpack and Microscience Easycard may interfere with access to the CPU socket and may prevent the installation of some accelerator boards. The Easycard also obscures the 8087 socket when mounted in the far right slot.

1-inch wide and 12 inches long can be used to cover the portion of the vent that is under the diskette drives. On later PCs part of this vent has been covered by IBM with tape. The Mountain Drivecards come with a piece of tape and instructions for this modification.

Some users might want to add a hard-disk card as a second hard disk to supplement an existing internal or external drive. Others might install the hard-disk card first, then add a second drive. In either case, adding a second drive is not a straightforward procedure because of the complex manner in which DOS interacts with hard disks.

The boot routine in the computer's ROM has the ability to integrate into the system add-on cards (such as graphics or disk controllers) that have their own on-board ROM code. After the boot routine has established the default interrupt vectors, it looks through absolute addresses C8000H - F4000H examining the code (if any) present at 2KB intervals. A valid adapter card ROM is signaled by a 55H and AAH being present in bytes 0 and 1, respectively, of the first 2KB block of the ROM. After a checksum is performed to test the integrity of the ROM module, control is passed to byte 3 of the ROM code (byte 2 contains a length indicator giving the number of 512 byte blocks in the ROM). The ROM routine does what is necessary to attach the adapter card to the system, for example, establishing and intercepting interrupt vectors. Control is then passed back to the boot

routine, which goes on to examine the next 2KB block for additional ROM-based adapters.

Once the hard-disk controller has been attached to the system, DOS accesses the controller via four of the 8088's I/O ports. In the PC and compatibles, memory address C8000H is reserved for the base address of the controller's ROM BIOS code, and I/O ports 320H-323H are reserved for communication with the controller. Base address CA000H and I/O ports 324H-327H are reserved for a second hard-disk controller. Because most controllers are capable of managing two hard disks, a two-disk system can have either both disks under the same controller, or each with its own controller. With two disk controllers in the system, the possibility of trouble exists: if the ROM BIOS initialization routines of the two controllers are incompatible, conflicts may arise in interrupt usage or some other aspects of the low-level system access, preventing one or both controllers from functioning properly.

All of the reviewed hard-disk cards come from the factory configured as the first controller (that is, at ROM BIOS base address C8000H and I/O ports 320H-323H); they can be changed, via jumpers on the controller, to be the second controller (at CA000H and 324H-327H). Thus, all of them have the potential to coexist with another hard disk and controller. Furthermore, the controllers on all of the reviewed cards, with the exception of the Hardcard 20,

can manage a second hard-disk drive in addition to the drive on the card. This makes it possible, at least in theory, to remove the original controller and have the controller on the hard-disk card control not only its own drive but also the second drive.

Some of the manufacturers provide detailed instructions on configuration, cable connection, and formatting for a two-disk system, and even offer cable kits for connecting a second drive to their controller. Others provide no information at all, and two (Qubié and Western Digital) have even mounted their controller cards so that it is impossible, without disassembly, to reach the jumper pins and cable connections.

## OTHER CONSIDERATIONS

During operation, the read/write heads of a hard disk are kept floating just above the platter surface by the air flow generated by the rotating platters. In some disks, when the power is turned off and the platters coast to a stop, the heads come to rest on the platter surface. This is usually a gentle process that poses no threat of damage. For an extra safety margin, some disks (such as the Plus Hardcard 20) have a mechanical mechanism, called *head lifting*, that lifts the heads away from the platter surface when power is removed.

Head lifting is distinct from *head parking*, which refers to moving the heads, usually under software control, over a section of the platter that is not used for recording data. Head parking is recommended when the disk is going to be moved and may be subjected to rough handling, which might cause the heads to impact the platter surface and damage the magnetic coating. Most hard-disk mechanisms are capable of head parking; however, not all vendors supply head parking software.

Another consideration when judging hard-disk cards is their lack of activity indicator lights. External and standard-mount internal hard disks usually have a small LED that lights up when the disk is being accessed. Because disks on a card are totally hidden from view, they can offer no such visual signal. Only one of the reviewed cards offers activity indicators, although the sound of disk access is loud enough on most of them to be heard over a quiet power supply. Software drivers for the Plus 20 Hardcard provide a visual indicator in the form of a small plus sign that appears in the upper right corner of the screen when the disk is being accessed in text mode; an auditory activity indicator produces a quiet clicking

sound through the computer's speaker during disk access. Both indicators can be turned on and off.

### THE TEST SEQUENCE

Each card in this review was put through the same sequences of tests. Two hard-disk benchmark programs were used to assess the cards' performances. ATDISK (see "Out from the Shadow of IBM," Steven Armbrust, Ted Forgeron, and Paul Pierce, August 1986, p. 52) measured two types of disk performance, low-level hardware operations and normal systems operations. Track-to-track seek time, average random seek time, and effective data transfer rate, all low-level hardware operations, were timed by using BIOS calls.

Normal system operations, i.e., file input and output, were timed by using DOS function calls to write, read, and then delete ten 20KB files. Performance on this last test varies depending on where the test files are located on the disk, and on the number of I/O buffers. Therefore, before this test was performed, the drive was reformatted with the format C:/s command; also, no BUFFERS= or FILES= statements were included in the CONFIG.SYS file.

AUTOTEST, the second benchmark, was first described in the article "Fixed-disk Benchmarks" by William Hunt (November 1984, p.64). This program times two types of disk operations: (1) reading data from varying numbers of sequential disk sectors, an operation typical of loading large program or data

files, and (2) reading data from random sectors at various head-travel distances (expressed as fractions of total disk width), an operation similar to updating single records in a database application. The results for both ATDISK and AUTODISK are shown in table 3.

The hard-disk backup program Fastback from Fifth Generation Systems, Inc. was installed on each hard-disk card, and its performance in backing up and restoring files was tested. Fastback worked perfectly on all of the cards. Its performance—that is, the time required to back up a given set of files—varied by only a few percentage points among all of the products tested. This indicated that Fastback's performance was limited by the diskette drive, and that speed differences among the hard-disk cards did not affect the results.

The tests included one to determine power consumption. One attraction of these hard-disk cards is that some of them will allow PC owners to add a hard disk without having to replace their original 63.5-watt power supply. Some hard-disk cards, such as the Hardcard Plus20, require so little power that one can be confident that they will function in a 63.5-watt PC with almost any combination of boards in the other slots. Others, such as the Express Systems 60MB twin, are so power-hungry that they require a 135- or 150-watt power supply even if most of the computer's other slots are empty.

To determine which of these disks can function in a 63.5-watt PC, tests

were run in a typically loaded PC with the original IBM 63.5-watt power supply, two full-height diskette drives, a diskette controller card, an IBM Color Graphics Adapter, an AST Megaplug memory card with 256KB, one printer port, and one serial port. The tests also were run on a fully loaded PC containing all of the above plus either a full-length internal modem (Hayes 1200B) or half-length IBM asynchronous communications card, depending on the physical configuration of the card being tested. (Some of the hard-disk cards did not leave sufficient room in the system for a full-length modem.)

The test consisted of cold booting the disk and then, using a batch file, copying files between the hard disk and both diskette drives for 15 minutes. By keeping one or the other diskette drive motor running constantly, this routine would place as large a load (if not larger) on the power supply as would ever be encountered in normal use.

With one exception, the cards that failed this test did so as soon as the computer was switched on. The power supply shut itself off within one second of being turned on. The one exception was the Mountain Drivecard 20, which booted successfully but became erratic during the copying test, causing "General write failure" error messages in the fully loaded PC. In the partially loaded PC, however, this card performed without any problems.

The results of the power consumption test should be interpreted with

2.3	2.3	2.5	2.4	2.1	4.0	2.5

The difference between a 20MB and 30MB disk system need not lie in the type of media or the number of surfaces. RLL encoding can allow a drive capable of storing only 20MB via MFM recording to contain 30MB without physical modification.

caution. Only the Hardcard Plus20 has low enough power consumption to operate in a 63.5-watt PC with essentially any combination of other boards. The other cards that passed this test all consume 13-14 watts, so that in a fully loaded PC they probably cause the power supply to operate at near maximum output. For memory, modem, or other cards requiring slightly more power than do the ones used in this test, the power supply may need to be upgraded (see the accompanying sidebar).

### CARD SURVEY

**CMS.** The CMS Drive Plus consists of a Western Digital controller and a Tandon hard disk. It does not come with any software; the DOS programs FDISK and FORMAT are needed to prepare the disk. Low-level formatting has been done at the factory.

The instruction manual is short and to the point, but it contains the necessary information to install and use the drive. One problem with the documentation is that it describes an earlier design of the Drive Plus that differs slightly from the evaluated unit. The earlier design required power from the power supply through a Y-cable, and obscured half of the slot to its right.

In contrast, the tested unit derives all of its power directly from the bus, and its shape is such that a full-length card can be mounted to its right, while no card can be mounted to its left. Thus, the Drive Plus occupies two full slots unless it is mounted in the far left

slot of a PC (the speaker does not need to be moved), in which case it takes up only one full slot. In terms of function, the Drive Plus agrees with the manual.

CMS's warranty on the Drive Plus requires some explanation. CMS will honor the warranty for one year after the drive has been purchased by the dealer, but the dealer is expected to handle all of the warranty service. CMS does not wish to deal directly with end users for either sales or service. To some extent the warranty terms are determined by the dealer who sells the unit, who may honor the full year as allowed by CMS or may limit the warranty to less than a year to cover shelf time before the unit is sold.

**Express Systems.** Express Systems markets a full line of hard-disk cards; models 2060 and 6060 were the tested products for this review. Both models use the LaPine Titan 3532 hard disk and Omti controllers. The 2060 uses one drive and an MFM controller to provide 20MB of storage, while the 6060 uses two drives and an RLL 2,7 controller to provide 60MB.

For an additional \$95, a software utility called Coalesce is available that will overcome the DOS limit of 32MB per volume and allow the 6060 to act as one 60MB volume. Coalesce is actually a private-label repackaging of Golden Bow Systems' VFeature Deluxe, which was reviewed in connection with other large disk systems that break the DOS 32MB barrier. ("Breaking the 32MB Barrier," Thomas V. Hoffman, May 1986,

p.94.) Without Coalesce, the 6060 installs as two 30MB drives (C: and D:).

Both of the Express Systems products come from the factory with low- and high-level formatting; once the card is installed, the user needs only to invoke the SYS C: command to copy DOS to the disk drive. The factory formatting is for a 8,192-byte cluster, so that users of DOS 3.x may want to reformat the disk (FORMAT C:/S) to obtain the benefits of a smaller cluster size. Although most users will not need them, utility programs have been provided for low-level format, with possible interleave factors of 1:1, 2:1, and 5:1.

The OMTI controller used by the Express Systems disks can control two hard disks and can coexist with another controller. The manual states otherwise, but it was printed before a controller firmware update made such coexistence possible. Instructions for connecting an existing hard disk to the Express controller are provided in the instruction manual, and a telephone number for technical support is provided if help is needed. Cables for connecting the second disk are available from Express Systems for \$35. If specified when ordering, the necessary jumper settings will be shipped with the card.

The Express Systems cards come with a program, HDINIT, that allows a PC1 to recognize the hard-disk card. They also provide an installation program that copies HDINIT from their distribution disk to the user's diskette and modifies the AUTOEXEC.BAT file to run

## HARD-DISK CARDS

HDINIT upon booting. This installation program is rendered useless because HDINIT causes the computer to reboot, and therefore, running it from an AUTOEXEC file will result in an endless cycle of reboots. The correct use of HDINIT.COM is simply copy it to the boot diskette and run it from the keyboard after booting.

**Microscience.** While similar in operation to the other 20MB units, the Easycard has a different physical configuration. It is a full-length card, but unlike the other tested units, it has the disk drive mounted at the bus end of the card (toward the rear of the computer). By installing the Easycard in the rightmost position so that the drive overhangs the CPU socket, it takes up only one full slot. If installed in any other slot, the Easycard requires two full slots. Accelerator boards using ribbon-cable access to the CPU socket *cannot* be installed with the Easycard in the right slot. In contrast to Qubié Hardpack 20, the Easycard does not interfere with access to the coprocessor socket.

The Easycard's disk and controller are manufactured by Microscience. The instruction manual is short and to the point and includes instructions for connecting the Easycard controller to a second hard disk. The brief instructions might pose problems for users who are unfamiliar with computers. Information on the utility programs that come with the card is not in the manual, but in an ASCII file on the utility disk.

**Mountain Computer.** The Drivecard 20 and Drivecard 30 look very similar and use disk drives that are, at least externally, identical. The 20MB model uses an MFM controller and the 30MB model uses an RLL 2,7 controller. The disks and controllers do not have a manufacturer's name on them (they are labeled, "Assembled by Mountain"), and a Mountain spokesperson said that this is "proprietary information."

The Drivecards can coexist with another hard disk/controller combination, using the Drivecard as the second hard disk and the original hard disk as the boot disk. The Drivecard controllers also can manage a second disk. Mountain recommends that only another Mountain 30MB drive be used as a second drive with the 30MB Drivecard controller. The 20MB controller can manage the following second drives: standard XT drive; Seagate ST412, ST225, and ST4051; NEC D3126 and D5146. Cables for connecting a second drive are available from Mountain.

**PC Source.** The Flashcard consists of a LaPine Titan 3532 disk and a Western

The three fastest drives in this evaluation all use RLL encoding, suggesting that the space efficiencies inherent in RLL create time efficiencies as well.

**PC's Limited.** The PC's Limited 20 Meg unit consists of a Tandon disk and a Western Digital controller. Once installed and formatted it performs well, but the installation instructions are in-

adequate. The instruction manual is largely inappropriate, because it is for a standard-mount internal hard disk and does not mention installing a hard-disk card. When asked, the technical support

people at PC's Limited said that a note should have been included telling the users to ignore the installation instructions, because it is assumed they will know how to install the hard-disk card in their computers.

The PC's Limited disk is the only one of those tested that did not come with low-level formatting. The low-level formatting software is contained in the ROM on the controller card and must be run before the drive can be formatted under DOS and used. PC's Limited instructs the user to execute the formatter by loading DOS DEBUG and transferring control to the formatter's address in ROM using the G command. The formatting process is not difficult, and only involves entering the interleave factor and indicating whether the drive to be formatted is the first or second attached to the controller. Nontechnical users may find this process somewhat forbidding. A short DOS program to execute the low-level formatter would be better than requiring DEBUG for what amounts to a JUMP instruction. PC's Limited intends to supply such a program in a future release.

PC's Limited card requires a separate connection to the power supply (as do several of the others), but does not automatically include a Y connector for use in cases where the power supply does not have an extra lead. The Y connector is available separately for \$7.50.

**Plus Development.** The Hardcard 20 stands out as being by far the thinnest and the least power-hungry. Plus Development designed a hard-disk card especially for compactness and low power consumption, rather than using a standard off-the-shelf disk as all the other products in this review do. Only one inch thick at its widest point, the Hardcard fits in any single slot between two full-length cards, anywhere in a PC or XT. Its power consumption is only eight watts, at least five watts less than any other disk tested.

The Hardcard 10 has a reputation for excellent reliability, and published mean time between failures (MTBF) figures for the Hardcard 20 have increased to 40,000 hours over 25,000 for the Hardcard 10. This is in many cases twice the MTBF figure for other hard-disk card products. The Hardcard 20 is also 15 percent faster than the Hardcard 10 overall, and leads most of the other hard-disk cards in almost every performance measurement for effective data transfer rate from disk.

The Hardcard comes with a menu program called Hardcard Directory, which allows users to select and run ap-

## THE SEARCH FOR POWER

By and large, the 130-watt power supply in the PC/XT will operate with any combination of expansion cards on the I/O channel, including all of the hard-disk cards reviewed here. The 63.5-watt supply present in the PC, however, was not designed for hard disks and will not support the typical complement of add-on cards along with a hard-disk card without overloading. Under overload conditions, a well-designed power supply does not overheat, nor does it vary its output voltages beyond specified tolerances. It simply shuts down, as was the case with several of the tested cards.

IBM's 130-watt power supply (identical to the supply in the XT) may be purchased from IBM dealerships for \$325. The supply is both UL approved and certified to comply with FCC Part 15 regulations. Its specifications are summarized in the accompanying table.

A host of compatible power supplies, some costing less than \$100, have become available in recent years as the cost of add-on hard disks has plummeted. Most of these are imported and are identical to the PC and XT power supplies in physical dimensions. All of them quote electrical specifications identical to—or better than—IBM's. Some of the points to consider in shopping for power supplies are these:

**Power output.** While most upgrade power supplies provide either 135 or 150 watts, at least two vendors, Eltech and West Coast Peripherals, are offer-

**TABLE: IBM 130-watt Power Supply DC Specifications**

VOLTAGE DC Nominal	CURRENT (amps) Maximum	REGULATION	
		+%	-%
+5.0	15.0	5	4
-5.0	0.3	10	8
+12.0	4.2	5	4
-12.0	0.25	10	9

The power supply also provides a 3.6-amp switched outlet at the input line voltage, which will support virtually all PC-oriented displays.

ing a 180-watt supply, and May Corporation offers a 200-watt supply for the XT. (The power supply in the PC/AT, by comparison, is 192 watts.)

**Noise level.** No specification exists for power supply noise level, so evaluating supplies before purchase is difficult. Noise level increases with power, so even IBM's 130-watt supply will be noisier than the original 63.5 watt supply in the PC. In general, however, the imported power supplies are noticeably noisier than IBM's. One exception is the Silencer from PC Cooling Systems, a 155-watt supply that is far quieter than IBM's original 63.5-watt PC supply. It has been measured at 36 dB at one meter, compared to 44 dB for the PC/XT, 84 percent quieter.

**UL and FCC approval.** UL approval is a general indicator that a product presents no gross safety hazards. FCC approval under Part 15's electromagnetic interference (EMI) regulations indicates that a supply will not add significantly to the PC's EMI output. Not all

power supplies carry UL and/or FCC approval; those that do are indicated in the list of vendors below.

**Connector pin type.** Even though some of the imported power supplies are identical in size to the PC and XT supplies, they cannot be installed in either machine because the motherboard power connectors are not compatible. While IBM motherboards use a rectangular pin .095 inch by .036 inch, the incompatible supplies are designed to mate with a .045-inch square pin used on many compatible motherboards.

**Warranty.** Warranty periods and terms on power supplies vary widely.

It is always a good idea to inquire about "restocking" fees when ordering goods through the mail. If a power supply is not compatible with a particular machine and yet has not failed, the vendor may deduct a penalty fee from the purchase price before issuing a refund.

plication programs from a menu rather than by entering DOS commands. The operation of this menu software is very similar to the Automenu shareware program available on many bulletin boards. The instruction manual for the Hardcard 20 is excellent.

**Qubié.** The Hardpack 20's physical configuration is unique among the cards tested. Rather than mounting the disk and controller end-to-end, the Hardpack mounts them side-to-side, resulting in a package that is short and wide. If it is mounted in the PC's short slot (the one closest to the power supply), it extends over the CPU area and takes up only one slot. The extremely tight fit requires diskette drive A: to be slid forward as far as possible so that the Hardpack can be installed.

The drive mechanism protrudes far enough to the right of the bus to completely obscure the CPU socket and about half of the coprocessor socket. Aside from obvious difficulties in installing a coprocessor, the Hardpack also makes it impossible to install an accelerator board that requires ribbon-cable access to the CPU socket. In this it is similar to the Microscience Easycard.

The Hardpack consists of a Tandon disk and a Qubié controller. In addition to several hard-disk utilities, the Hardpack comes with Bourbaki's 1Dir (visual shell) and Zylab's ZYINDEX (file search/index). The version of ZYINDEX included is limited to approximately 100 files, and an order blank is included giving one-third off the price of the full-powered version of ZYINDEX.

The instruction manual for the Hardpack is reasonably clear and complete, but the photographs of the instal-

lation steps are so murky as to be useless. The manual consists of a collection of loose IBM binder-size pages; the pages are not prepunched for a binder. **Western Digital.** The FileCard 20 uses a hard disk made by the Fuji Electrical Co. and, of course, a Western Digital controller. Unlike the Western Digital 10MB FileCard, the FileCard 20 has no provision for piggyback memory or other add-ons. It comes with Executive Systems' XTREE disk management software and a clear and complete instruction manual that is punched for insertion into an IBM-size binder.

### ATTRACTIVE ALTERNATIVES

Any of these cards provides a functional hard-disk system with the benefits of increased speed and storage capacity. If two slots are available with a hefty power supply and substantial storage needs, the Express Systems 6060, at \$1,095, is an attractive alternative to more expensive high-capacity hard disks. This unit may also appeal to those who want to use one of its 30MB disks as high-speed backup for the other.

Among the smaller capacity models, no clear winners or losers stand out. The benchmark results show that overall performance differences between these hard-disk cards are relatively insignificant. The results also show that no single benchmark measure can give a true picture of a card's overall performance. For example, of the 20MB hard-disk cards, the one with the fastest random access time (Hardcard Plus20) had the slowest performance on the DOS files test, while the hard-disk card with the slowest random access time (CMS) had the fastest DOS files test.

Close inspection of the benchmark tables reveals that the variation in performance on the DOS file copy benchmark is fairly small across all products tested. However, this test was conducted on newly formatted disks with essentially no file fragmentation. Once a disk has been in use for some time and fragmentation has increased to normal levels, the performance of disks that have very fast random seek and random read times, such as the Plus Hardcard, can be expected to improve markedly.

Space and power considerations are more likely to be deciding factors. If only one slot is available and the original power supply is to be used, the CMS Drive Plus, the Hardcard Plus20, the Mountain 30MB Drivecard, and the Qubié Hardpack are the only choices. The Plus20 and Mountain 30 are a bit faster than the Qubié, but they are also significantly more expensive.

If 1½ slots and a 63.5-watt power supply are available, the PC's Limited unit deserves consideration. It is a no-frills unit that performs well at a very attractive price.

For only one slot and an upgraded power supply, the Express Systems 2060, Mountain Drivecard 20, and Western Digital Filecard are available choices. Finally, 1½ slots and a power supply upgrade make the PC Source Flashcard a possibility.

# How to 386

It's simple.

With Intel's Inboard™ 386/AT.

It fits right into your IBM® AT or compatible, and gives you all the performance of a 386 system.

Without having to buy a 386 system. (Which, if you've priced one lately, is about three times as expensive.)

Inboard 386 is based on the revolutionary 32-bit, 16 MHz 80386 chip *we* invented. So it'll work with all the

software you've got sitting on your desk. As well as any add-in boards you may have hiding in your computer—like, just for instance, the Above™ Board. Which we also invented.

Inboard 386 lets you whiz through recalcs with Lotus® 1-2-3®. And it makes your network server serve you even faster. In fact, it'll make any program serve you faster.

And with 386 control software,

# your AT.

you can take advantage of exceptional multitasking capabilities. Like putting together a presentation while your computer is downloading data. (A slightly more efficient way of doing business.)

Don't forget our five-year warranty. Or toll-free technical support line.

To find out more, check with your favorite computer dealer or call us at (800) 538-3373.

And see why Inboard 386 beats the system.

OUT FROM THE SHADOW OF IBM:

# TeleCAT-286

*TeleVideo's AT compatible offers a few extras by combining a high-resolution color/graphics adapter and high-quality monochrome monitor, but it suffers from subtle incompatibilities.*

STEVEN ARMBRUST and TED FORGERON

**T**he TeleCAT-286 is the latest venture of TeleVideo Systems, Inc. into the personal computer market. With the chunky, boxy appearance that characterizes TeleVideo products, the TeleCAT-286 packs the power of an 8-MHz PC/AT into a small and affordable package. Subtle compatibility problems stand between this machine and a high recommendation, however.

The computer tested in this article contained 512KB of memory, a 20MB hard disk, a 1.2MB diskette drive, TeleVideo's high-resolution color graphics board, and a TeleVideo monochrome monitor. The system board came equipped with a serial and a parallel port as

standard equipment. The accompanying sidebar lists the features available with the TeleCAT-286.

With custom chips shrinking the size of AT motherboards, small-footprint machines are becoming more common. These smaller machines are often limited in the number of drives they can hold. The TeleCAT-286 provides a balance between physical dimensions and storage capacity. The system unit measures 16.5 inches by 16 inches by 6.25 inches, 28 percent smaller than the AT. Photo 1 compares the footprint of the TeleCAT-286 with the AT's.

Like other machines with smaller system units, the TeleCAT-286 cannot

hold as many drives as the AT, which has two storage bays that can handle two half-height diskette drives and two full-height hard disks. The TeleCAT-286 has a single storage bay in which two half-height drives can reside. The half-height 20MB hard disk is mounted on its side next to the storage bay; the 1.2MB diskette drive is mounted in the top of the bay, leaving the bottom available for expansion. The empty slot can be used to house either a diskette drive or a hard disk; data cables are provided for both, and a power connector is conveniently placed for easy installation. Photo 2 shows the inside configuration of the system unit.

**PHOTO 1:** *System Unit Footprint*

**PHOTO 2:** *Inside the System Unit*

**PHOTO 3:** *Keyboard Comparison*

**PHOTO 4:** *Rear of the System Unit*

**PHOTO 5:** *TeleCAT-286 Styling*

**PHOTO 6:** *Slide-rail Mechanism*

*Photo 1:* The TeleCAT-286's system unit is considerably smaller than the PC/AT as indicated by the dotted lines.

*Photo 2:* Inside the system unit, the hard disk is mounted on its side to the right of the diskette drive.

*Photo 3:* The keyboard is similar in layout to the AT keyboard. The status lights are conveniently placed on the keys.

*Photo 4:* The rear of the system unit shows the built-in serial and parallel ports, as well as the processor speed switch.

*Photo 5:* The TeleCAT-286 has the styling that is distinctly TeleVideo. It features a TeleVideo monochrome monitor.

*Photo 6:* When disconnected, the system board slides out the front of the unit for easy access to the interior.

The unit tested contained a 20MB Seagate drive, the average access time of which is rated by TeleVideo at 85 milliseconds (ms). *PC Tech Journal* tests rated the average access time at 74.6 ms. This places the drive in a category with those used in the PC/XT and compatibles, rather than in the AT category where a 40-ms access time is normal. The TeleCAT-286's disk controller includes a buffering technique, however, that permits the drive to be formatted with an interleave of one, which increases its effective transfer rate beyond that of the AT's hard disk.

The controller contains 1KB of dual-port RAM that is used for I/O buffering. When programs write to disk, the TeleCAT-286 transfers the data to the RAM buffer on the disk controller. After the first sector has been placed into the RAM buffer, the system can retrieve the next buffer while the controller simultaneously writes the first sector to disk. Read operations are performed in a similar fashion.

With this extra buffering in the disk controller, the TeleCAT-286 can read and write information fast enough so that it can operate effectively with the disk formatted with an interleave of one. Therefore, even though the hard disk is a relatively slow model, its transfer rate is better than that of an AT because the TeleCAT-286 can read or write the same amount of data in fewer revolutions of the disk.

Undoubtedly, cost considerations played a large part in TeleVideo's decision to gain AT-class disk performance via the controller and software instead of by using a faster (and more expensive) disk drive. Not only is the TeleCAT-286's drive less expensive, but it also uses less power, thereby permitting TeleVideo to use just a 140-watt power supply, as opposed to the 192-watt model found in the AT.

Although the positioning of the hard drive on its side is efficient use of space in the system unit, it robs the user of essential feedback because TeleVideo did not make the drive's access light visible from outside the unit. The light can be seen only when the system unit cover is off. The decision to make a front panel without an LED opening was undoubtedly a cost consideration.

Two other items that are missing are a keylock switch and a power indicator light. The absence of the power indicator light is especially unfortunate because the power switch is located on the back panel of the system unit where it is normally impossible to see and hard to find. The TeleCAT-286 has a

particularly noisy fan, however, which provides a fairly clear, audible indication of when it is running.

The keyboard is a pleasant surprise. At first glance, it appears to be a generic, low-cost keyboard that could accompany any inexpensive AT compatible. What distinguishes this keyboard are its quick action and positive tactile and audio feedback. While it still does not have the same feel as the original AT keyboard, it is close enough that even the most adamant IBM admirer can become used to it.

The keyboard layout is nearly identical to that of the original AT keyboard, one difference being that the keylock lights are located on the keys themselves rather than at the top of the keyboard. Photo 3 compares the TeleCAT-286 and IBM keyboards. As with the AT, the TeleCAT-286 keyboard plugs into the back of the system unit. It is plug-compatible with the IBM unit, so that users can replace the keyboard with other models if they wish.

The TeleCAT-286 system board has sockets for a full megabyte of memory as well as a serial port (9-pin male connector) and a parallel port (25-pin female connector). The connectors are the same as those used in the AT, and the ports are functionally equivalent. The system board is loaded with configurable options. In addition to the standard switch that chooses monitor type and the amount of system board memory, jumpers on the system board can be used to switch the serial port between COM1 and COM2 and the parallel port between LPT1 and LPT2. One drawback is that these ports cannot be disabled. Photo 4 shows the positions of the two ports located on the rear panel of the system unit.

Also on the rear panel is a processor speed switch that is used to move the processor between 6- and 8-MHz modes. The coprocessor speed can be set to match the CPU (4 MHz with a 6-MHz CPU or 5.33 MHz with an 8-MHz CPU), it can be set to 4.77 MHz regardless of CPU speed, or it can use a custom clock supplied by the user. This may be used, for example, to circumvent a copy protection scheme that allows the CPU to run only at a particular speed but could be enhanced by a faster numeric coprocessor. No software-controlled switching is available.

The TeleCAT-286 has only five expansion slots: one 8-bit slot and four 16-bit slots. The 8-bit slot is normally occupied by the video adapter, and one of the 16-bit slots houses the combination diskette/hard-disk adapter. With a serial port, a parallel port, and sockets for 1MB of memory on the system board, many users will find that the three remaining slots are sufficient for most of their needs.

## VIDEO EXTRAS

As might be expected from a manufacturer of terminals such as TeleVideo, the TeleCAT-286 comes equipped with a high-resolution monochrome monitor as standard equipment (see photo 5). The monitor is of excellent quality and has the extra touches that come from years of experience. The screen is large, measuring 13 inches diagonally, and it produces easy-to-read green characters on a nonglare background. The monitor rests on a wide tilt-and-swivel base that makes it especially convenient for use on a desktop with the system unit placed to the side on the floor—the cable provided is long enough to permit such a configuration.

## TALK OF THE TOWN

### One language supports this community.

That language is Pascal-2, now on the PC and producing the fastest, most compact code available. For the professional programmer, imagine what you can do with this power:

- Cut execution time by 20% to 200%
- Transport MS-DOS programs to VAX, PDP11, and 68000 machines with only minor adjustments
- Cut executable program size by up to 50%
- Use all of DOS-addressable memory through efficient large-memory model
- Speed error correction and save development turn-around time with sophisticated error checking and reporting
- Find and fix logical errors with the interactive source-level debugger
- Access DOS services

## Pascal-2™

FOR MS-DOS

and network files ■ Call Microsoft FORTRAN, C, Pascal, and assembler ■ Upgrade from TURBO Pascal with compatible strings, equivalent procedures and access to TURBO graphics.

### Plus!

- Intel CEL87 mathematical library for scientific computing
- A special interface between Pascal-2 and the programmable BRIEF text editor (editor optional).
- Certified ISO standard Level 1.

**Dramatically improve your productivity and introduce your PC software to the VAX next door.**

The high-resolution color graphics board is compatible with both IBM's Monochrome Display and Printer Adapter and the CGA.

The TeleVideo monitor does not have a separate power cable; the data cable that plugs into the video card also carries power to the monitor. Although eliminating a cable from the spaghetti wiring that lurks behind most micro-computers is a good idea, the one-cable approach could be dangerous to users who try to connect other monitors to the TeleCAT-286's video card without first reading the manual and setting switches on the card.

The combination of the TeleVideo monitor and high-resolution color graphics board gives the TeleCAT-286 some features not available with the AT. The monochrome monitor, which produces text characters comparable to those of the IBM monochrome display, can be used in graphics mode. The graphics board is compatible with both IBM's Monochrome Display and Printer Adapter and Color Graphics Adapter (CGA). In addition, it provides high-resolution graphics modes not available on either the CGA or Enhanced Graphics Adapter (EGA). Table 1 lists all the video modes supported by the TeleVideo color graphics board.

In the base configuration, the graphics board contains 32KB of video memory. The system uses 4KB of this memory when emulating the monochrome display, starting at address 0B000H (where memory for the IBM monochrome adapter normally resides), and 16KB when emulating the CGA, starting at address 0B800H (where CGA memory normally resides). With this scheme, the graphics board provides direct support for all eight video modes (0-7) used by the monochrome adapter and CGA. Either emulation mode can be switched off to enable the card to coexist with other video cards.

The TeleVideo color graphics board has an 8KB ROM character generation table that provides two different fonts for use in the monochrome-compatible mode (7) and in the CGA-compatible, high-resolution text modes (2 and 3). Both fonts include the standard 256 characters and use an 8-by-16 dot pattern for each character position. The individual characters have a 7-by-9 font size with two descenders.

The two fonts are referred to as single-dot and double-dot. As the name implies, double-dot mode produces wider and fuller characters that look better on TeleVideo's large monitor. However, some uppercase characters (particularly X, Y, and Z) are too wide when displayed in double-dot mode and tend to merge with other wide characters around them. A switch on the graphics board toggles between single-dot and double-dot modes. The switch is conveniently placed at the back edge of the board where it can be accessed from outside the system unit without removing the cover.

The board also has sockets for additional memory, allowing it to contain 128KB of video RAM. When the full complement of memory is installed, the board supports additional text and graphics modes: a 640-by-400 black-and-white mode, a 320-by-400 four-color mode, and a 640-by-400 sixteen-color mode. However, none of these modes is compatible with those provided by IBM's adapters, nor are they compatible with other popular graphics cards, such as those produced by Hercules, Tecmar, or Plantronics. Software that uses these modes would most likely have to come from TeleVideo. The company offers a driver that enables AutoDesk's AutoCAD to use the extended video modes. Tele-

Video will make it available to users at no charge upon request.

The monochrome monitor that is supplied with the TeleCAT-286 can display the high-resolution, 640-by-400 black-and-white mode; to display the extended color modes, one of the following color monitors must be used: Taxan 640, Tatung CM-1370, Nanao 8040, or Nanao 7040.

#### STANDARD SOFTWARE

Both DOS and BASIC are optional with the TeleCAT-286. The unit tested in the article was run under TeleVideo's MS-DOS 3.1 and GW-BASIC 3.1. For the most part, these are standard packages, with several of the DOS commands written by TeleVideo, primarily to support its buffered disk controller and video adapter. The commands that display a TeleVideo copyright include

SYS.COM	KEYBSP.COM
FORMAT.COM	KEYBUK.COM
FDISK.COM	KEYBFR.COM
MODE.COM	DISKCOPY.COM
LABEL.COM	DISKCOMP.COM
GRAFTABL.COM	RESTORE.EXE
GRAPHICS.COM	BACKUP.EXE
KEYBGR.COM	TREE.COM
KEYBIT.COM	

The only items missing from TeleVideo's DOS package that are included in IBM's DOS are the TopView program information files, BASIC.PIF and BASICA.PIF, and the new DOS 3.2 commands, XCOPY and REPLACE.

Three extra commands are included with TeleVideo DOS that are not part of IBM's DOS package: IDISK.COM, a low-level disk formatting program; PARK.COM, a program that parks the heads on the hard disk in preparation for moving it; and SETUP.COM, a set-up

# QuadEMS+ "The Right Way To Do Memory"

Stewart Alsop, P.C. Letter

Computer experts are praising QuadEMS+ as the smartest new memory product for the IBM Personal Computer. With the QuadEMS+ package from Quadram you extend the life of your personal computers with increased power and capability. QuadEMS+ turns even old PCs into top-of-the-line performers. It's the fast, cost-effective way to make the most of the PCs you've got.

## Compatibility

QuadEMS+ ensures software compatibility with new expanded memory applications, like 1-2-3, Release 2.0, Symphony, and Framework II. Plus, you can run multiple applications concurrently in enhanced Expanded Memory, using your current software and the new expanded memory releases.

## Installs Itself

QuadEMS+ is so smart it even installs itself. There are no switches or jumpers to confuse you. You just plug it in, press a key, and it does the rest, automatically configuring itself to your system. QuadEMS+ makes moving up to expanded memory a snap. What could be easier?

With QuadEMS+ you can access large amounts of data quickly, run large programs in expanded memory, instantly access multiple programs, and eliminate idle waiting time with concurrent processing. QuadEMS+ is the right way to add memory to your system.

For more information on the board the computer experts are praising, visit your local computer dealer and ask about QuadEMS+. Or contact us at One Quad Way, Norcross, Georgia, 30093, 404-923-6666.

## Productivity

Concurrent PC DOS XM comes as a bonus with QuadEMS+. It supports expanded memory and multitasking so you can run up to four of your favorite DOS applications at the same time without modification. Its windowing ability, programmable function keys, and menu-driven design make Concurrent PC DOS XM easy to use.

IBM PC is a registered trademark of International Business Machines. Concurrent PC DOS XM is a trademark of Digital Research Inc. QuadEMS+ is a trademark of Quadram Corp.

**QUADRAM**  
An Intelligent Systems Company

program that sets the date and time on the battery-powered clock, sets the display adapter and disk drive types, and sets the amount of memory. All of these functions are available on the AT, but in different forms. Parking the heads and setting up machine are functions found on the IBM Diagnostics disk. The low-level formatting program is also included as part of the diagnostics disk. (TeleVideo does not provide any diagnostic programs.) TeleVideo's SETUP.COM is an improvement over the IBM set-up program. It is menu-driven, explains the entire procedure on one screen, and is very easy to use.

### INSTALLING TELECAT

The TeleCAT-286 is as easily installed as most other AT-class machines. The cover of the system unit is fastened with four screws on the rear panel. A medium-sized Phillips screwdriver can be used to remove them and any other screws in the system unit. The cover is a wrap-around type like that of the AT; once the screws have been removed, the cover slides forward and tilts up and off. The front panel is entirely plastic, and although the plastic seems sturdy enough, this is not a cover that should be casually flung across the room after it is removed.

Even though the system unit is small, installing hardware in the TeleCAT-286 is not difficult. The single-width drive storage bay uses a slide-rail mechanism that enable the drives to be removed easily. The slide-rail mechanism is unique to TeleVideo, so third-party drives cannot be installed without adding rails. (This equipment can be purchased separately from TeleVideo distributors or from TeleVideo directly.) Small metal plates fastened with screws on the front panel hold the drives in place, so the user does not need to pull out cards or move cables to reach any screws. A third power connector is tied-wrapped on top of the power supply for use with an additional drive.

Users adding their own hard-disk drives must know which drive types are supported (see table 2). The TeleCAT-286 supports IBM drive types 1 through 6, 8, 9, and 11, but TeleVideo types 7, 10, 12, 13, and 14 are not the same ones supported by the AT.

Although adding an extra drive is easy, removing the vertically mounted hard disk looks next to impossible. The drive is held in place by screws that are accessible only when the drive is removed. If this drive goes bad, the entire system unit probably will need to be taken into the repair shop.

**TABLE 2: Hard-disk Types**

12 <sup>a</sup>	640	8	43	640	480
13 <sup>a</sup>	1,024	8	69	1,024	768
14 <sup>a</sup>	1,024	5	43	1,024	768

<sup>a</sup> These types are not the same as the corresponding IBM PC/AT drive types.

The installation of third-party hard disks should be performed with care. Special mounting hardware is necessary, and not all of the disk type numbers that are supported are the same as IBM's disk type numbers.

Inserting or removing expansion cards is about as easy as with any other AT-class machine. Plastic card guides are included in the unit. The card area is a tight fit for any cards that are the least bit longer than normal or that have large connectors that must fit through the rear panel. Individual card guides can be popped out to provide more room for these long cards.

TeleVideo's design makes the TeleCAT's system board fairly accessible. Instead of laying out the board so that the coprocessor slot and RAM sockets can be reached from inside the unit, TeleVideo made the system board itself easy to remove. Seven screws hold it in place: two on the outside of the front panel, two inside by the rear panel, one close to the center of the board, and two on the rear panel attaching the serial and parallel connectors. Any expansion cards must be removed to reach all seven screws. Then the battery, speaker, and power cables must be disconnected, and the system board will slide forward from the lower part of the front panel (see photo 6).

Neither the drives nor the power supply has to be removed in order to take out the system board. Once the board has been removed, memory chips and the numeric coprocessor are easily installed. While the procedure itself is quite simple, some users may have trouble the first time they attempt to remove the board because the user's manual neglects to mention three of the seven screws.

### TESTS LEAVE DOUBTS

All of the computers reviewed in this series on AT compatibles undergo two kinds of tests. First, a set of commonly used hardware and software products is installed into the test machine to check for compatibility, and then the *PC Tech Journal* Evaluation Suite for compatibility and performance is run. The results are compared with an 8-MHz AT. See the article "Out from the Shadow of IBM . . .," by Steven Armbrust, Ted Forgeron, and Paul Pierce (August 1986, p. 52) for details on the programs that make up these tests.

The add-on hardware products installed into the TeleCAT-286 for testing include an 80287 numeric coprocessor chip, Intel's Above Board with 4MB of memory, the IBM EGA, Microsoft serial and bus mice, and a Hayes Smartmodem 1200B.

The software products tested include Microsoft's Windows and Word to test the mice and graphics capabilities; Borland's SuperKey, SideKick, and Turbo Lightning to evaluate memory-resident programs; Living Videotext's Ready! to test expanded memory; Hayes' Smartcom II to test the communications port; and the IBM SETUP program and Advanced Diagnostics for a general check-up. A quick run-through with Lotus' Symphony was also performed.

Although this common core of products is always used for testing purposes, new products are often added to the test base. IBM's VDISK was added to the test suite for this article after several

## HERE'S HOW YOU CAN BENEFIT:

Save up to 50% on each megabyte of storage you buy. NMS makes the 12 hour work day obsolete because our products provide the performance pipeline your system needs... not the bottlenecks that slow your system down. NMS makes it possible for you to pay less the larger the storage system you select. In fact, the larger the disk capacity the less you pay!

## HERE'S WHY:

NMS controllers and complete memory systems provide performance that is faster than conventional disk system while you save up to 1/2 the cost per megabyte.

Take advantage of 16 millisecond access times and 2.4 megabyte/second data rates! If you do, you may be able to transfer 5 megabyte files in as little as 26 seconds! NMS memory systems and multifunction controllers give the greatest flexibility in disk system configuration, capacity range, cpu, network and operating system compatability.

Look ahead for 1987...

Look to National Memory Systems for your disk, tape, and laser optical storage needs.

readers pointed out that some AT compatibles either have trouble switching in and out of the 80286's protected mode or they do not use the same mechanism that the AT uses when performing the switch. The VDISK program switches in and out of protected mode to manage extended memory as a virtual disk and, therefore, VDISK seems an ideal candidate for testing the interface. The hard-disk backup program Fastback version 5.13 from Fifth Generation Systems also was added to check the direct memory access (DMA). New hardware packages added to the test suite for this article include the IBM Game Adapter and the Cheetah memory expansion card (to test zero-wait-state memory).

All of hardware products worked as they should, including the IBM Game Adapter and Cheetah card. The EGA, however, required a separate monitor to function properly.

Of the software products tested, IBM Diagnostics disk, Fastback, and Microsoft Word experienced serious problems that leave doubts about the computer's compatibility.

The Fastback restore program worked correctly, but the backup program did not. With the TeleCAT-286 running in 8-MHz mode, the backup never completed successfully. Instead, it exited to DOS, rebooted the computer, or hung the system. When the computer was running at 6 MHz, a backup completed successfully one time out of ten tries, but it still reported the messages "8 hard disk errors" and "8 controller resets" while backing up 19.6MB of data. This casts a dark shadow on the compatibility of the TeleVideo's buffered disk adapter.

When using Word on the TeleCAT-286 the computer was not able to refresh the screen properly. This was apparent when using the spelling checker, which displayed a double-line border around the entire screen. When the proof option was invoked to check a document for spelling errors, part of the border disappeared and one of the characters in the spell menu was missing. The checker worked, but the screen was not displayed properly.

More seriously, the TeleCAT-286 crashed several times when running Microsoft Word, often when repaginating a document. Sometimes a warm reboot would restart the system, but, often, turning the power off and on was necessary to recover. The problems were not regular; sometimes repaginating worked without problems. The crashes occurred often enough, however, to indicate significant compatibility

problems. The same operations were performed on the same document without difficulty when using an AT.

Problems also occurred when a menu, usually the spell-checking menu, was left on the screen for a long period of time (10 or 15 minutes) with no selection made. The system locked up and required a reboot. After a reboot, invoking even the DIR command could produce erratic results, such as scrolling the directory diagonally from right to left up the screen. Another reboot would then be necessary.

These problems seem to be related to the video adapter, as was also the case when running the IBM Diagnostics program. Diagnostics thought that the TeleCAT-286 contained both a monochrome adapter and a color/graphics adapter, but the monochrome adapter test failed. Furthermore, the hard-disk test returned the message "1712 error-cause undetermined" on the error detection and correction test, and the dis-

***ATBIOS, which checks the BIOS and BIOS data area, shows that the TeleCAT-286 BIOS uses the data area in the same way as the AT.***

kette test failed the sequential access, random seek, and verify disk tests. The diskette test also thought that the 1.2MB diskette was a 360KB model and returned a "603 diskette size error".

The five programs that comprise the *PC Tech Journal* AT Evaluation Suite also were run on the TeleCAT-286. Table 3 lists the results.

ATBIOS, which checks the BIOS and BIOS data area, shows that the TeleCAT-286 BIOS uses the data area in the same way that the AT does. The test does not reveal conclusively who designed the BIOS, because TeleVideo's name is the one in the copyright statement and no other readable strings appear in the BIOS address range.

ATPERF measures CPU and numeric coprocessor clock rates, as well as memory access times. It shows that the performance of the TeleCAT-286 is on a par with the 8-MHz AT. Only the CGA video write numbers are worse than the corresponding numbers for the AT. On the TeleCAT-286, the CGA tests measure the performance of TeleVideo's high-

performance color/graphics board. Thus, the figures indicate that writing to its video memory is only 75 percent as fast as writing to the CGA memory.

ATFLOAT, which measures floating-point operations with the numeric coprocessor installed, and ATKEY, which checks for keyboard compatibility, both show results equivalent to that of the 8-MHz AT. ATFLOAT shows that the TeleCAT-286 can process floating-point operations at the same speed as the AT. ATKEY verifies keyboard compatibility. The AT keyboard also works when plugged into the TeleCAT-286.

In measuring hard-disk performance, ATDISK provides the most surprising results. As noted earlier, the track-to-track and average seek times show that the TeleCAT-286's hard disk is a slower model than those generally found in AT compatibles, but the effective transfer rate of the disk is almost three times that of an 8-MHz AT. This difference is due to the buffering algorithm used in TeleVideo's disk controller, which allows the disk to be formatted at an interleave of one so that the controller can accept data as fast as it spins by the read head.

The combination of relatively slow head movement and relatively fast transfer rate presents an interesting question of just how good the overall disk performance is when used in a normal environment. The DOS file I/O portion of the ATDISK program provides a partial answer, because it reads and writes 20KB files, thus offering a mix of head positioning and sequential I/O. The results show that the TeleCAT-286's disk performs better than a typical XT-class hard disk but worse than drives that are normally in ATs and compatibles.

However, the results of the DOS file I/O test may not be a true indication of how the TeleCAT-286's disk will perform in all circumstances. Applications that do a lot of seeking to various places on the disk will probably run slower on the TeleCAT-286 than on the AT. On the other hand, applications that read and write large amounts of sequential data might run faster.

#### **GOOD FOR THE PRICE**

Also of importance when evaluating the AT compatibles in this series is documentation and support. As might be expected from a manufacturer of low-cost computers, the TeleVideo documentation is not as slick as that provided by the major vendors. The DOS and BASIC manuals both were generated on a letter-quality printer, but are adequately organized and contain the basic set of

<sup>a</sup> The figures for the IBM AT are the average results from several machines, whereas the results from the TeleCAT-286 are taken only from the review model.

<sup>b</sup> Figures shown in parentheses represent the relative performance expressed as a percentage compared to PC Tech Journal's baseline machine, the 8-MHz, 30MB AT.

The buffering system on the disk controller of the TeleCAT-286 may affect the way the disk performs with different applications. Random-like seeking on the disk will probably run slower on the TeleCAT-286 than on the AT, while it is possible that applications using sequential data might run faster.

reference material. The *User's Manual* obtained for review was a preliminary copy, but it is easy to use; it contains drawings of all the switch and jumper settings, and explains most of the options adequately. The only glaring error is in the installation section, where the manual fails to mention all the screws that hold the system board in place. TeleVideo encloses a postcard for users to send in for the final manual.

TeleVideo offers a standard 90-day parts and service warranty. During that time, users can return computers to their dealers for repair, or they can contact the TeleVideo technical support staff, who will attempt to diagnose the problem over the telephone. No toll-free support line is available, but callers are seldom left hanging on the line waiting for someone to help them.

At the time of this review, TeleVideo was putting the final touches on a new support policy that is one of the best in the PC industry. This policy provides free, on-site support for the first 90 days of ownership from a third-party service organization.

The TeleCAT-286 offers good performance for the money. With 8-MHz performance, built-in serial and parallel ports, a combination monochrome and graphics adapter, and room for 1MB of memory on the system board, this computer can be ideal for the small business or individual on a tight budget. It has room for only three drives and has only three slots available for extra expansion cards, but the TeleCAT-286 offers features that make installing an extra drive, a numeric coprocessor, or extra memory very easy.

The problems experienced using Microsoft Word and Fastback shed doubts on how compatible this computer really is, especially in terms of the video adapter and disk controller. The problems encountered here seem to be subtle ones that might not surface immediately, so potential buyers should perform detailed testing before purchasing the TeleCAT-286.

# Best Computer Magazine

**W**e are proud and honored to have been selected as the "Best Computer Magazine" by the Computer Press Association in its first annual awards.

At the awards ceremony, it was said that "PC TECH JOURNAL has substance, style and clear writing combined with superior information, value and contemporary graphics."

Indeed, it would be difficult for us to express more succinctly the standards we set for ourselves in publishing PC TECH JOURNAL. And we accept with appreciation the fact that our professional colleagues have recognized our achievement.

By concentrating on the rapidly growing need for information about PC systems, PC TECH JOURNAL has created a unique publication for PC systems experts, the key segment of an extremely sophisticated market.

This award as the "Best Computer Magazine" commits us even more toward the development of PC TECH JOURNAL as the information source for those dedicated systems professionals whose vision and industry are fast making the personal computer the most important business tool ever invented.

# Display Adapter Bottleneck

*Graphics performance may be limited not by CPU clock speed, but rather by display adapter demands on video RAM.*

MICHAEL ABRASH

**T**he success of graphics-oriented software depends largely on performance. Whatever other virtues a given graphics package may have, rapid screen handling makes software responsive and satisfying to use, while anything less leaves users frustrated. It is safe to say that the faster the graphics, the better. A logical corollary is that programmers should fight to save processor cycles when they are writing graphics software.

The enemy of speedy graphics operations is the very adapter that displays the graphics. An integral part of the operation of all popular display adapters is the insertion of wait states that can slow graphics operations by a factor of two or more. The PC/AT programmer, in particular, must understand the opera-

tion of display adapters, for in the AT a confluence of factors creates a display-memory bottleneck of astonishing impact. Accesses to display memory are significantly different from accesses to normal memory, and the effects of this disparity cannot be taken for granted, especially in display memory-intensive applications such as windowing and icon-based interfaces.

The bottleneck between software and the IBM Enhanced Graphics Adapter in the PC/XT and the AT is not a single, easily quantified event, but rather a dynamic interaction between the processor and display adapter circuitry. Knowledge of the exact mechanism of the bottleneck is far less important than a general understanding of its impact on program performance. Toward that

end, the benchmarks in this article provide actual timings that should assist the user in designing effective graphics software. The code used for the timings is modified from "Out From the Shadow of IBM," by Steven Armbrust, Ted Forgeron, and Paul Pierce (August, 1986, p. 52). The results shown in this article were produced by the program that is shown in listings 1 and 2. Listing 1, BOTTLE1.C, was compiled with the Microsoft C compiler 4.0; listing 2, BOTTLE2.ASM, was assembled with the Microsoft Macro Assembler 4.0.

### WAIT STATES

Wait states are signaled to a microprocessor to indicate that the processor should delay completion of the current instruction until some external event has finished. They are a means of telling the CPU to stretch out the current operation to match the relatively slow speed of a peripheral. In the case of the XT, the processor (CPU) is the 8088, and the signaler is typically an add-on card that inserts wait states because it cannot complete an operation as rapidly as the 8088 expects it to.

All of the popular display adapters for the XT, including the EGA, the IBM Color Graphics Adapter (CGA), the Hercules Graphics Card, and the IBM Monochrome Display and Printer Adapter, routinely insert wait states during CPU read and write operations to display memory. The CPU is forced to wait when accessing display memory because it is not the only requester of display memory accesses. The display adapter itself constantly reads display memory in order to obtain the information that controls the pixels displayed on the screen.

To comprehend the tremendous number of display memory reads that must be performed by the display adapter in order to refresh the display, consider in color graphics mode, 60 full screens (frames) are displayed every second. In Mode 10H, the EGA's highest-resolution mode, approximately 28,000 bytes of video data are displayed in each frame.

The EGA's architecture causes the display adapter to demand memory access cycles at the same rate even during the retrace periods, when the adapter does not require video data from display memory. Consequently, additional display memory accesses cycles are lost to the CPU. The resulting 1.5-million-per-second memory accesses performed by the EGA use an extremely large portion of the total memory bandwidth of the EGA. Even in lower-resolution

**FIGURE 1:** Best-case CPU Display Access

If the CPU attempts to access display memory just *before* a display memory access that is available for CPU use occurs, then the CPU may have to wait for less than one character clock before the access is allowed.

**FIGURE 2:** Worst-case CPU Display Access

If the CPU attempts to access display memory just *after* a display memory access that is available for CPU use occurs, then the CPU may have to wait for three or more character clocks before the access is allowed.

modes, a significant part of the available bandwidth of display memory is used to provide video information. As a result, in all display modes the CPU is forced to wait on each display memory access until one that is free for CPU use becomes available.

Display memory wait states are unavoidable and consume a sizable portion of all available accesses to display memory. The important question is how significant a performance penalty does this impose. The *Technical Reference* manual mentions that, "At least one wait state will be inserted on all memory and I/O accesses from the CPU." True enough, but this statement fails to convey the magnitude of the wait state penalty.

In order to calculate the effect of display memory wait states, the average length of each wait must be determined. This means that the cause of the wait states must be examined. Wait states during CPU accesses to display memory are inserted while the display adapter reads bytes from memory that are needed for video information. The maximum duration of each of these reads is slightly less than one *character clock*, the time required to generate one character on the screen. (In all

graphics modes on the EGA, CGA, monochrome, and Hercules adapters, a character clock is the time required to draw eight pixels, the width of a standard character is 640-pixel-wide modes.) If each read by the display adapter took a full character clock, then no memory accesses would be free for CPU use except during retrace times, and CPU memory access would be severely limited. However, graphics adapters are designed so that even in the worst case, the CPU can use at least 20 percent (one out of every five) of the total display memory accesses.

If the display adapter makes one out of every five memory accesses available to the CPU, then the time the CPU has to wait before a given access to display memory is completed depends on the timing of the request relative to the next access that is available to the CPU (see figures 1 and 2). If the CPU requests display memory access just before an available memory access, it may have to wait for less than one character clock, as shown in figure 1. On the other hand, if the CPU requests access just after an available memory access has occurred, it may have to wait for three or more character clocks, as shown in figure 2.

**TABLE 1: XT String Operations, EGA Mode 0EH**

OPERATION	SOURCE	DESTINATION	1,000 COUNTS	FRACTION OF SYSTEM MEMORY PERFORMANCE
REP STOSB	N/A	System RAM	258	1.00
	N/A	Display RAM	534	0.48
REP STOSW	N/A	System RAM	361	1.00
	N/A	Display RAM	900	0.40
REP MOVSB	System RAM	System RAM	451	1.00
	System RAM	Display RAM	601	0.75
	Display RAM	Display RAM	901	0.50
REP MOVSW	System RAM	System RAM	655	1.00
	System RAM	Display RAM	1,137	0.58
	Display RAM	Display RAM	1,600	0.41

N/A = Not applicable

Timings were made on an IBM PC/XT at 4.77 MHz, with an EGA in mode 0EH (640 by 200, 16 colors, 14.318-MHz dot clock).

In the PC/XT, access to display RAM is roughly half as fast as to system memory. As all transfers are 8 bits wide, word access exacts less additional penalty.

This random interaction of these two asynchronous events, the character clock and the timing of CPU display memory accesses, means that the effects of wait states are probabilistic and therefore can only be described as averages. On the average, the CPU will have to wait for about two character clocks during a randomly timed memory access to display memory.

The time consumed by wait states on access to video memory is controlled by character clocks, because it is determined by the memory access characteristics and demands of the video data fetching circuitry; the CPU must wait until the video circuitry has finished fetching video data for the moment. This is a key point that looms large in AT operation.

The length of a character clock varies with display mode and character-clock speed. In the 640-by-200 medium-resolution modes of the EGA (modes 06H and 0EH), the dot clock runs at 14.318 MHz so an eight-dot character clock occurs once every 559 nanoseconds. Consequently, the average time the CPU waits on a display memory access is about 1.1 microseconds.

Although 1.1 microseconds does not seem like a long wait, the XT's system clock runs at 4.77 MHz so that the wait time actually amounts to about five CPU wait states—five processor cycles during which the CPU could have been working. This is certainly more significant than "At least one wait state," acknowledged by IBM. For example, because of wait states a REP STOSB instruction, which normally executes in 10 system clock cycles or 2.1 microsec-

onds per byte when writing to nondisplay memory, takes an average of 3.2 microseconds to execute when performed to display memory, approximately 50 percent more slowly than expected. This has important implications for the time required for actions such as screen filling and clearing.

Word accesses to display memory suffer to an even greater extent from the wait state penalty. The 8088 performs word-sized memory accesses as two byte-sized memory accesses, just as if two byte-sized read or write operations had occurred in rapid succession. The first byte written in this manner suffers just as does any other byte-sized memory access, waiting for an available display memory access for two character clocks on average.

The second byte-sized memory access is performed immediately after the first byte access is completed. Unlike the first access, the timing of this memory access is not random with respect to the next display memory access that is available for CPU use. Because the first access has just taken an available display memory access, another display memory access does not become available until four character clocks after the first access. This means that the second byte of a word access to display memory always takes 2.2 microseconds. Only 1.4 microseconds of this time is actually wait state penalty, because slightly more than 0.8 microseconds is required for a normal memory access. Nonetheless, the second byte of every word access to display memory takes more than twice as long as an access to nondisplay memory. In total, the average wait state

penalty on a word access to display memory is 2.5 microseconds.

On the XT, the REP STOSW instruction normally executes in 14 CPU cycles per word, or 2.94 microseconds. Access to display adapter memory would seem to be almost twice as slow as access to normal memory. The benchmarks in table 1 show an impact that is actually worse than these estimates. To obtain the timings in table 1, the linked program was run on an IBM EGA in a 4.77-MHz XT. The timings in table 1 indicate that display adapter wait states actually slow REP STOSB by about 2 times and REP STOSW by about 2½ times. The table also shows that REP MOVSW is affected to about the same extent as REP STOS; this is the most damaging finding by far for the EGA.

The EGA has enough memory to store more than two full screens in all modes. Predrawn objects, copy buffers, fill patterns, and other bit-mapped data can be stored in the EGA's extra memory. This is particularly advantageous because special hardware in the EGA allows all four planes of EGA memory to be copied with just one CPU read and one CPU write, avoiding the many reads, writes, and OUTs that would be required to copy a multicolored image from system memory to EGA memory. In fact, this is the only reasonably efficient way to manipulate EGA bit maps.

These bit maps are moved as blocks, and REP MOVSW is the best instruction for block moves. Unfortunately, as table 1 indicates, block moves with EGA memory as both the source and destination take two or more times as long to execute as would the same block move performed in normal memory. This makes the XT less than ideal for bit-map manipulation, an issue that will recur redoubled regarding the AT.

## CONSIDERATIONS AND CAVEATS

The wait state penalties described above are for the worst possible case on the XT, in that they access display memory as rapidly as possible. Most display memory access actually is less intensive, because processing time is required in preparation for display memory access as well as for other program functions. Moreover, not all block moves use video memory for both source and destination. Block moves from system memory to video memory suffer considerably less loss to wait states than do block moves from video memory to video memory. Routines that rely on other than string instructions are likely to be less heavily impacted than the string-oriented benchmark routines, be-

The major factor in performance when accessing display memory rapidly is the timing of CPU accesses relative to display memory accesses available for CPU use.

cause other instructions do not access memory as frequently as the string instructions do.

The measured impacts of wait states shown in table 1 do not agree exactly with the estimates that were made above. Determining the precise effect of wait states is complex, for two reasons. First, system RAM refresh occurs once every 15 microseconds. Refresh makes all timings approximately 7 percent longer and consequently diminishes the relative impact of wait states. Second, all of the discussion thus far has assumed that CPU accesses to display memory are timed randomly with respect to the next memory access that is available for CPU use. However, instructions such as REP STOSW access memory so rapidly that the timing, in fact, is not random; rather, the CPU synchronizes with the available display memory access slots that become available on every fifth character clock.

In the case of REP STOSW, each word-sized write to memory takes 12 character clocks (three available display memory accesses) or 6.6 microseconds: one display memory access is used for each byte written, and one available memory access is missed while the 8088 processes the microcode for REP STOSW (see figure 3). When refresh occurs once every 2½ STOSW instructions, an additional free memory access is missed. As a result of the interaction of the timing of available display memory accesses and CPU execution times, both bytes written by REP STOSW wait for the full time between available memory accesses, and the effect of wait states is greater than predicted.

The ultimate result of system refresh, available memory access synchronization, and instruction prefetch is that the effect of wait states is unique for each instruction stream that accesses display memory. Estimates of performance loss for any given instruction

stream, therefore, can only be approximate. In addition, different adapters in different modes may run at different character clock speeds and insert different numbers of wait states. For example, the 320-by-200 graphics modes (modes 04H and 0DH) allow the CPU three out of every five display memory access cycles, but run the character clock at only half the speed of the 640-by-200 modes. Timing consistency among compatible adapters is not entirely reliable either; an EGA compatible card that was tested for comparison produced benchmark timings that varied by as much as 8 percent from those that were generated on an IBM EGA.

The resolution/color combination of a given mode does not inherently affect CPU performance when accessing display memory. All that matters is the frequency with which the CPU may access display memory, which derives from the speed of the character clock and the frequency of accesses available to the CPU. This is why modes 06H and 0EH perform identically, even though one provides only 2 colors and the other provides 16 colors.

Text modes rarely require display memory access at a frequency that would make the bottleneck a problem. Wait states, nonetheless, are inserted in text modes as well as in graphics modes. The listings accompanying this article can easily be used to examine text mode wait states, simply by selecting a text mode and the appropriate display memory segment address when prompted; in fact, the impact of the display memory bottleneck in any mode that is supported by the BIOS can be examined similarly.

### BOTTLENECK IN THE AT

The video memory access situation goes from serious in the XT to catastrophic in the AT. Not only does the AT suffer from the wait state penalty to a greater

# dBug/EGA

The only debugger designed especially for the new EGA graphics standard is now available from Cybernetic Micro Systems

only **\$99** (not copy protected)

## User Interface

dBug/EGA is a program that uses six dedicated windows to step through your code:

## Animation

A free demo program, the Star Juggler, provides source code to show you how to take advantage of EGA features as you learn to use the debugger. A 100+ page manual, with numerous screen dumps, walks you through the demo.

## Font Creation

dBug/EGA allows you to create new characters easily. Issue the "F" command. Then use the cursor keys to select a pixel in the 8 x 14 font array. Then "+" or "-" will set or reset the pixel. When you finish creating the new character, "ESC" will save it, and your program can now use it. New fonts can be saved to disk and then reloaded for future use.

## Color Palette

dBug/EGA allows you to easily alter any color in any palette register by typing Cn=color, where Cn stands for register #n. For example, C3=2 will change color register 3 to green (=2). This feature allows you to quickly try new color schemes in your graphics program using up to 16 color registers.

## Multi-Window Debugging

dBug/EGA saves the "User Screen" when a breakpoint is reached and replaces it with a multi-window "debug Screen" for single stepping through Assembly Language Source Code that you write. dBug/EGA displays your names and labels along with registers, stack, and memory values. dBug/EGA even draws a flowgraph for your documentation. On-line help is always available, and the single-key commands will prompt for any required parameters. The debug screen and application (user) screen are maintained separately, and either can be viewed on command.

FlowGraph

Color Palette

Requires IBM PC-XT-AT or clone, 256K RAM, EGA card+256K, DOS 2.0 or newer.

# At last! - Fast, On-screen FLOWCHARTS

Finally! An on-screen flowchart processor that knows about flowcharts - not just another "screen draw" program that makes you do most of the work.

**Interactive EasyFlow** is a powerful full-screen graphics program dedicated to flowcharts and organization charts. With this program you can quickly compose charts on the screen. More important, you can easily modify charts so they are always up to date.

**Features:** • Text is automatically centered, character by character, within shapes as you type it • Text formatting controls allow you to over-ride the automatic formatting where desired • Lines are created by specifying the starting and ending points - the program automatically generates the route • Cut and paste facility allows arbitrary chart fragments to be moved, copied rotated, reflected or sent to/from disk • Shape insert-delete and row/column insert-delete • Charts can be up to 417 characters wide by 225 lines high. Charts too wide for the printer are automatically printed in strips. • Charts can be larger than the screen - the window into the chart scrolls both horizontally and vertically as necessary • Works with many popular matrix printers including Epson, IBM graphics printer and compatibles. Full support for HP LaserJet and LaserJet Plus. Works with

HP 7475A (& compatible) plotters. Can be used with ANY printer when non-graphic (character) output is acceptable

• All standard flowcharting shapes included • Most shapes supplied in large, medium and small sizes • Extensive manual (100+ pages) includes many examples • Context sensitive "help" facility provides immediate assistance at any time • Any number of titles can be placed on a chart • Commentary text blocks can be placed anywhere in the chart • Fast: written in assembly language • Plus many more features than we can mention here

Requires at least 320K memory, DOS-2 or higher and an IBM or Hercules compatible graphics card. On EGA, full 640x350 resolution is used.

Order direct for only **\$149.95** + \$2.00 S&H (USA/Canada), \$10.00 (foreign). Payment by MO, check, VISA, MasterCard, COD or Company PO. Rush orders accepted (\$15.00 S&H; USA/Canada only). Rush orders received by noon will be delivered the next business day (to most locations).

Order Desk: **1-800-267-0668**

The sample screen display shown below is typical of what you see while editing a chart. Other screen displays are provided for entering titles, changing options, getting "help" and so on.

## BOTTLENECK

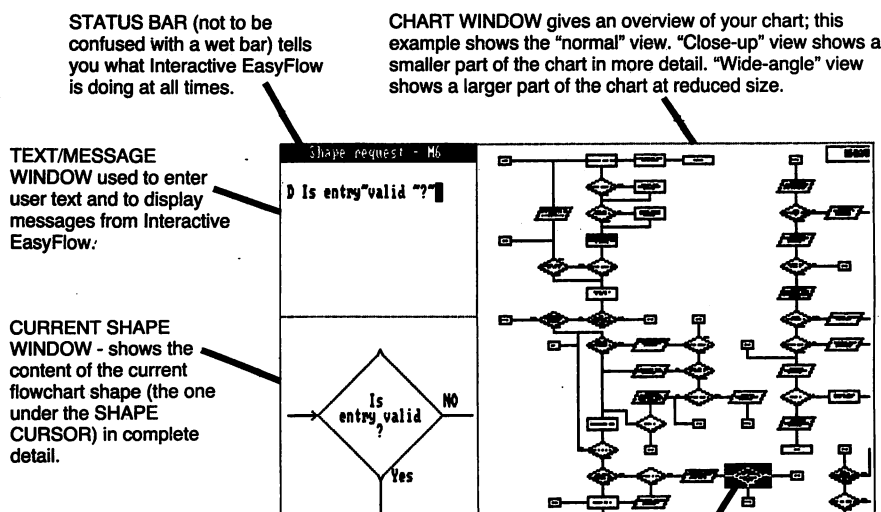

extent than does the XT, but it also penalizes display memory accesses because the display adapters are 8- rather than 16-bit devices.

The time consumed by video wait states on any given video memory access is determined by the display adapter's character clock, not by the system clock and not by the CPU's performance characteristics. This means that the higher clock speed of the AT and the higher performance of the 80286 come to naught when accessing video memory, because the 80286 in the AT ends up waiting for the same period of time—an average of 1.1 microseconds per access—as does the 8088 in an XT. The AT is capable of executing instructions three to five times as rapidly as the XT; therefore, the wait state penalty causes far greater graphics performance degradation in this machine.

Repeat string instructions suffer greatly from wait states, because 80286 string instructions execute so rapidly that all accesses after the first one have to wait almost the maximum time for the next display memory access that is available for CPU use. As a result, bytes can be written to display memory only as memory accesses become available to the CPU, at a maximum rate of one byte every 2.2 microseconds. A REP MOVSB instruction normally takes six CPU cycles, or 750 nanoseconds, to work between nondisplay memory in an 8-MHz one-wait-state AT.

When accessing display memory as both source and destination, wait states would cause REP MOVSB to take 4.4 microseconds—2.2 microseconds to read the byte and 2.2 microseconds to write it. This is a total wait state penalty of 3.65 microseconds, slowing the performance by a factor of six. The AT must perform two accesses to display memory in order to write a word, because the display adapter can support the writing of only a single byte at a time. As a result, from wait states alone, REP MOVSW takes twice as long as REP MOVSB. At 8.8 microseconds, this is 11 times slower than the performance when accessing normal memory.

Wait states are not the only source of performance degradation when accessing video memory in an AT. The memory on all popular video adapters is organized as 8-bit-wide memory. This allows the adapters to work in both the 8-bit PC and the 16-bit AT, because the AT can emulate an 8-bit computer for the purpose of supporting PC adapter cards. Unfortunately, the AT accesses 8-bit devices very slowly. A normal memory access takes 3 CPU cycles,

# Some people need low price AND high performance in their LAN...

**People like Resellers,  
Distributors, OEMs,  
VARs, End Users.**

People who sell LANs, and people who use LANs will tell you: TiaraLink is the price/performance leader in local area networks for the IBM® PC market.

Their reasons are sound:

- #1 TiaraLink supports DOS 2.0 through 3.2 and a complete NetBIOS.
- #2 Thousands of TiaraLink networks are installed worldwide on IBM PC, XT, AT and compatibles.
- #3 LanWare,™ the network operating system software, is a one-time purchase regardless of the number of servers on the network. So your cost-per-station decreases as your network grows!
- #4 Gateways allow your networked PCs to operate both as terminals to a remote mainframe, and as network PCs.

*"TiaraLink is an excellent product for us to carry. ARCnet\* is a proven technology, around since 1978. Although ARCnet can be utilized with other companies' software, we still recommend TiaraLink. Tiara, the company, is great in terms of support, product availability, and margins. Customer reaction is super."*

—Bob Putignano  
President, Access Data Products, Inc.  
Mt. Vernon, NY

## Here's what they say about TiaraLink.

*"TiaraLink is the only high performance LAN on the market with reasonable software pricing. That fact, combined with its ease of installation and operation, total reliability, fault recovery and multiple server capability is why we chose TiaraLink to distribute with our computers."*

—Allan D. Dale, President  
OnSite Business Systems, Inc.,  
a division of  
Dale Computer Corporation  
Okemos, MI

*"The TiaraLink network has allowed (us) to grow from 5 nodes to over 100 nodes with no problems. We continue to add disks, printers, and plotters easily... Even with over 400 megabytes of storage in 17 hard disks, user response time is great!"*

—Gerd Hoeren  
Senior Software Engineer  
Integrated Measurement Systems, Inc.  
Beaverton, OR

REP MOVSW	System RAM	System RAM	96	1.00
	System RAM	Display RAM	626	0.15
	Display RAM	Display RAM	1,067	0.09

N/A = Not applicable  
Timings were made on an IBM PC/AT at 8 MHz, with an EGA in mode 0EH (640 by 200, 16 colors, 14.318-MHz dot clock).

PC/AT word access to 8-bit display RAM is twice as slow as byte access, because the CPU must wait on the display adapter for each byte transfer of each word.

whether the access is byte or word (so long as the word is at an even address) in size. However, a byte access to 8-bit memory takes 6 CPU cycles, and a word access to 8-bit memory takes 12 CPU cycles—four times as long as a word access to 16-bit memory.

Again, the REP MOVSW instruction normally requires only 6 CPU cycles per word, or 750 nanoseconds, to execute. When both the source and destination are video memory, the same instruction takes 24 CPU cycles, or 3.0 microseconds, disregarding wait states.

If the wait state and 8-bit penalties were additive, the performance loss on word-sized block moves from video memory to video memory at 8 MHz would be about 15:1, 11:1 from wait states, and 4:1 from the 8-bit penalty. Table 2 shows the impact on an 8-MHz AT—about 11:1. Astoundingly, an AT is only about 50 percent faster than an XT at manipulating blocks of display memory and a faster processor clock speed will not improve display memory block manipulation performance.

The timings in table 2 imply that for block moves, the 8-bit emulation effect is lost because the emulation overhead occurs during times when the CPU is forced to wait for the next available display memory access anyway. The actual performance loss is about the same as that predicted from wait states alone. For instruction streams that access display memory less intensively, however, the 8-bit emulation effect may have a much greater effect, because the 8-bit emulation effect and the display memory wait states may no longer overlap as completely.

As with the XT, not all video-oriented operations suffer to such a great extent on the AT, since the performance loss is in direct proportion to frequency of video memory access. Still, every display memory access clearly exacts a high price.

#### PROGRAMMING IMPLICATIONS

The most obvious implication of the display memory bottleneck is that display memory accesses should be minimized to as great an extent as possible. For example, data should be MOVED rather than XORed into display memory whenever possible. The XOR instruction accesses memory twice, once to read the memory operand and once to store the final result. Similarly, buffers should be maintained in system memory rather than in display memory whenever possible. Table 2 indicates that on the AT block moves between system memory and display memory are more than 50 percent faster than block moves involving only display memory.

The importance of minimizing display memory accesses varies with the application. In a dot-plotting routine, for example, the display memory bottleneck can be ignored because more time is spent in calling the routine, calculating the screen offset, and masking and inserting the pixel than is lost to the display memory bottleneck.

Applications that work intensively with blocks of memory are most likely to suffer from the bottleneck. Windowing applications, especially those relying on bit block logical transfer (BITBLT) drivers, are prime candidates for performance loss, although only block

## Marshal Pascal Discount!

We've seen a lot of Pascals, but this one takes the blue ribbon. Produces code smaller and faster than optimized C compilers. *ISO-compatible*. Supports the 8087 in-line (8087 code emulation option if you don't have the chip). *True relocatable linker* allows access to the Microsoft family of languages and assemblers. *Four memory models*. *Overlays*. *Variable-length strings*. *Structured constants and structured function values*. *Separate compilation of modules*. *Procedural parameters*. Powerful compile options (optimization by-pass for quicker compiles, syntax evaluator, I/O "fine tuning", etc.). *Turbo Pascal Translator* brings your present Borland programs over to a ISO/Marshal-readable format. Watch the difference it'll make in your software's code size and speed!

Suggested retail is \$189.00.

**TABLE 3:** XT MOV/LOOP Operations, EGA Mode 0EH

OPERATION	SOURCE	DESTINATION	1,000 COUNTS	FRACTION OF SYSTEM MEMORY PERFORMANCE
MOV/LOOP (byte)	System RAM	System RAM	1,543	1.00
	Display RAM	Display RAM	2,057	0.75
MOV/LOOP (word)	System RAM	System RAM	1,801	1.00
	Display RAM	Display RAM	2,880	0.63

Timings were made on an IBM PC/XT at 4.77 MHz, with an EGA in mode 0EH (640 by 200, 16 colors, 14.318-MHz dot clock).

MOV/LOOP transfers involve considerable CPU and instruction fetch overhead and are thus penalized much less by the display adapter than are string operations.

**TABLE 4:** AT MOV/LOOP Operations, EGA Mode 0EH

OPERATION	SOURCE	DESTINATION	1,000 COUNTS	FRACTION OF SYSTEM MEMORY PERFORMANCE
MOV/LOOP (byte)	System RAM	System RAM	432	1.00
	Display RAM	Display RAM	800	0.54
MOV/LOOP (word)	System RAM	System RAM	514	1.00
	Display RAM	Display RAM	1,441	0.36

Timings were made on an IBM PC/AT at 8 MHz, with an EGA in mode 0EH (640 by 200, 16 colors, 14.318-MHz dot clock).

As with string operations, MOV/LOOP access to display RAM suffers more on a PC/AT. Each byte of a word access must wait for an available display RAM access.

moves with the string instructions suffer to the extent shown in tables 1 and 2.

Tables 3 and 4 show the performance loss to the display memory bottleneck on the XT and AT respectively, during a block move performed with the MOV and LOOP instructions. In this instance, the bottleneck slows the performance by a factor of three at the most. While this is certainly significant, it is much less than the penalty of the string-based block move—by a factor of 11. This does not mean that block moves with MOV and LOOP are preferable to block moves performed with the string instructions. It does mean that the string instructions do not have the same advantage over the rest of the 8088 instruction set when accessing display memory that they usually do.

An astute programmer can improve overall program performance considerably by designing code that attempts to access memory only about as often as a display memory access becomes available to the CPU, performing other useful work between accesses. The disadvantage of such an approach is that it is highly dependent on the performance characteristics of both the computer and the display adapter. However, similar hardware-specific approaches to CGA display memory access have been taken in the past when speed was the overriding issue (see "Instant Screens," Augie Hansen, June 1986, p. 96).

The findings in this article are for specific code in specific configurations; different circumstances may not produce similar findings and will likely have different programming implications. These timings are not comprehensive. When working with display memory—as is often the case with the IBM PC family—the only way to be sure of the performance of any code is to time it in the target environment in order to obtain performance measurements relevant to individual applications. This article gives an idea of what to look for and how to measure it.

For example, tables 5 and 6 provide the same timings as tables 1 and 2, except that these timings were performed in the EGA's highest-resolution mode, mode 10H. Logically, the wait time in mode 10H might be assumed to be less than the wait time in mode 6 by the ratio of their dot clocks—16.257 MHz to 14.318 MHz or 13.5 percent faster—because character clocks and therefore available CPU accesses to display memory would occur proportionately more frequently in mode 10. The tables, however, show that while the wait times for some tests do indeed

## QuickBASIC just got quicker with

# QuickPak

QuickPak is a superb collection of enhancements, subroutines, and instructional material designed to help you get the most out of programming in BASIC.

- Powerful assembly language routines to give your programs more speed, more power, and full access to DOS and BIOS services.

Sort all or part of a string array with one command! FIND any string or sub-string within an entire array *regardless of capitalization* — accepts wildcards. READ directories into your programs from any drive or path. READ/WRITE disk sectors — create your own DOS utilities! CLEAR or SCROLL any part of the screen. MANY, many more programs included.

- Professionally written QuickBASIC routines and functions.

Powerful input routines for text, dates, and numbers. Menus, scroll bars, date/time functions, and much more.

- The Assembly Tutor — a complete guide to learning assembly language *from a BASIC perspective*. Learn how to create your own routines and extensions.

- Tips and Tricks book — packed with clever ideas and techniques to help you be a better programmer.

You get all this, all of the source code for *every program included*, and a thirty-day money back guarantee for only \$69.00.

No royalties are required for using any of the QuickPak routines in your programs. Not copy protected, of course.

by

**CRESCENT SOFTWARE**

64 Fort Point Street  
East Norwalk, CT 06855

	N/A	Display RAM	540	0.09
REP MOVSB	System RAM	System RAM	96	1.00
	System RAM	Display RAM	270	0.36
	Display RAM	Display RAM	540	0.18
REP MOVSW	System RAM	System RAM	96	1.00
	System RAM	Display RAM	540	0.18
	Display RAM	Display RAM	1,080	0.09

N/A = Not applicable

Timings were made on an IBM PC/AT at 8 MHz, with an EGA in mode 10H (640 by 350, 16 colors, 16.237-MHz dot clock).

String operation performance in mode 10H on the PC/AT is virtually identical to AT performance in mode 0EH, implying that the dot clock rate matters very little.

decrease by more than 20 percent, other wait times decrease to a lesser degree, and still others actually increase.

A final implication of the display memory bottleneck is that the AT does not provide the expected performance boost relative to the XT for heavily display-oriented applications. The AT certainly is faster, primarily because not all processing time is spent accessing display memory, but the improvement may be disappointing. The proper solution in the case of the AT is the development of 16-bit display adapters that support more intensive CPU access to display memory. This is particularly desirable because of the proliferation of bit-mapped graphics interfaces that require an AT for good performance.

Instructions that access display memory encounter barriers that are not readily apparent yet highly significant. Performance degradation that is due to display memory access is so great for the AT that until 16-bit display adapters or adapters with dedicated coprocessors come into wide use, graphics performance may be considered a serious weak point of the AT. Effective graphics programming for the IBM family demands all the understanding of this weakness—and clever coding—that can be brought to bear.

*Michael Abrash is a senior software engineer for Orion instruments of Redwood City, CA, a manufacturer of PC-based instrumentation and microprocessor development systems.*

# WE JUST GOT MORE SOPHISTICATED SO YOU CAN GET MORE BASIC.

**W**e invented BASIC over 20 years ago.

Later, we re-invented it for micros as the True BASIC™ structured-programming language.

And the idea was: To make programming as easy and natural as possible. So you could concentrate on what to program. Not how.

Now there's True BASIC Version 2.0 for the IBM® PC and compatibles. Faster, more powerful and sophisticated than the original.

## **MORE GRAPHICS.**

Right from the start, True Basic gave you terrific device-independent graphics. Built-in 2-D transforms. And support for multiple windows.

Now we've added more graphics and full mouse support.

So for the first time, you can create one program that will do superb graphics on CGA, EGA or Hercules displays. Without worrying about additional drivers or overlays. And on the EGA, you can SET COLOR MIX to define your own colors. Use four shades of blue if you want (and make our competitors green with envy).

## **MORE CONTROL.**

We always supported you with recursion, local and global variables and separately compiled libraries.

Now you can have *modules*, too, the industrial-strength tool for building large applications.

Using modules makes it easier for you to share data between routines. Build data structures. Then, if you want, hide them from other parts of the program. So you can always be free to focus on the task at-hand.

Modules have their own initialization sections, so you can set up global variables or turn on instrumentation.

And, like other procedures in True

BASIC, modules can be compiled separately and stored in a library where they can be shared by several applications. Or they can be loaded directly into the True BASIC environment as part of your customized workspace. So when you use True BASIC interactively, the modules look like built-in functions.

Modules made Modula-2 the successor to Pascal. Now they've put True BASIC one-up on all other BASICs.

## **MORE SPEED.**

2.0 is 20 to 200 percent faster than True BASIC Version 1.0. Both compile times and execution speeds. And on some real-world benchmarks, we're faster than many native-code compilers.

## **MORE POWER.**

Start with a complete matrix algebra package.

Then, since we support the use of 640K for both code and data, add arrays as large as you want.

Our compiled code is more compact than what other compilers generate, so there's more memory left for your application.

We've enhanced our dynamic array redimensioning and improved our built-in 8087/80287 support, making True BASIC the most powerful number-crunching BASIC around.

And if it's strings you crunch, we've added new string functions and raised the limit. So strings can be up to 64K characters long.

## **MORE DEBUGGING.**

We pioneered breakpoints and immediate-mode capability in a compiled BASIC environment.

Now we've added utilities that allow you to visually TRACE through your program, and check the values of selected variables. Or print a cross-referenced listing.

And new compiler options like NO LET and NO TYPO let you decide how strictly you want your variable names checked.

## **MORE INNOVATION.**

True BASIC has always had features like full-screen, scrollable editing. Block copy and block moves. And global search and replace.

Now, 2.0 keeps you on the leading edge of editing and file-management technology. With SCRIPT, to write the True BASIC equivalent of a DOS batch file. ECHO, to transfer your output to disk or printer. And ALIAS, to give you and your programs a better roadmap to your subdirectories.

There's also Version 2.0 of the Developer's Toolkit. With support for DOS interrupts. Pop-up menus. Even designer fonts.

And remember: your programs are portable to the other machines we support: the Apple Macintosh™ and Commodore Amiga®.

## **MORE SUPPORT.**

Call your local dealer. Call us TOLL-FREE at 1-800-TR-BASIC. Or write to: True BASIC, Inc., 39 South Main Street, Hanover, NH 03755. We'll send you more information. Including a free demo disk.

See for yourself. That we're still true to our basic idea.

## NEW FILEMOVER

by California Jack Cassidy  
\$59.95 (IBM PC, XT, AT or clone, 256K min.)  
Not copy-protected, includes Source Code

**F**ILEMOVER™ is perfect for Copying or Moving all types of files from disk to disk (or directory to directory).

Reorganize your disk library and make backups without hassle. FileMover is easy to use and menu driven. Hard disk compatible too. Subdirectory structure is preserved when files are copied. And, if your destination disk fills up, you can continue on another disk.

**FILE SORTER:** Automatically alphabetize directories by file name and/or extension. Transfer files to other disks in any order.

**FILE DISGUISER:** Hide/unhide files so only you know they exist. Alter file names, dates and times. Convert files to Read-Only status. Inspect files in Hex-ASCII format...

**QUICKSORT:** DOS's sorter is extremely s-l-o-w on anything but small jobs. FileMover's sorter is one of the *fastest* anywhere!

## Bonus-FOREVER FILE DELETER

Did you know that files you have "deleted" often stay on your disks, just waiting for someone to snoop through or undelete? FileMover's Super-Deleter totally ZEROES OUT unwanted files so they don't exist. Period.

## Free Turbo Command Chart

All of those Turbo Pascal™ functions and procedures on one chart that always stays in front of you. A great PC programming tool.

#### NEW! FROM BLAISE COMPUTING

Today's programmers need more than yesterday's tools. Requirements such as removable windows and "sidekickable" pop-up utilities are changing the face of program design. You need to filter interrupts so that other resident programs still work. You need the ability to switch between multiple display pages and monitors. Today's technical demands are almost endless, but C TOOLS PLUS gives you what you need.

# C Tools Plus<sup>TM</sup>

## For The Programmer Whose Alphabet Begins & Ends With "C"

Also Available Are:  
**C VIEW MANAGER** — A kit for building data entry screens and menus. Begin by designing on-screen what the operator will see; call upon our library functions from your program to display the screens and retrieve the data. Just \$275, including all library source code.

**C ASYNCH MANAGER** — provides the crucial core of hardware interrupt support needed to build applications that communicate. It

also includes the "XMODEM" file-transfer protocol and support for Hayes-compatible modems. All source code is included for \$175. **C TOOLS & C TOOLS 2** — an indispensable combination still available at a low price of \$175, including all source code. See review in PC Tech Journal, 6/85.

#### SOLID LIBRARY SUPPORT

Blaise Computing offers you solid library support that can meet all your demands and more. C TOOLS PLUS embodies the full spectrum of general-purpose utility functions that are critical to today's applications.

Here's just part of the PLUS in C TOOLS PLUS:

- ◆ **C TOOLS and C TOOLS 2** compatibility — two packages that receive rave reviews for quality, organization, usability and documentation.
- ◆ **FULL SOURCE CODE**

- ◆ **WINDOWS** that are stackable, removable, that support word wrap and that can accept user input.
- ◆ **INTERRUPT SERVICE ROUTINE** support for truly flexible, robust and polite resident applications.
- ◆ **MULTIPLE** monitor and display support, including EGA 43-line mode.
- ◆ **FAST DIRECT VIDEO ACCESS** for efficiency that will not constrain good program design.
- ◆ **DOCUMENTATION, TECHNICAL SUPPORT** and attention to detail that have distinguished Blaise Computing products over the years.

**C TOOLS PLUS** supports the Microsoft (and IBM) 3.00 and Lattice 3.00 C compilers and is just \$175.00.

# PC/VI™

## UNIX's VI Editor Now Available For Your PC!

Are you being as productive as you can be with your computer? An editor should be a tool, not an obstacle to getting the job done. Increase your productivity today by choosing **PC/VI** — a COMPLETE implementation of UNIX\* VI version 3.9 (as provided with System V Release 2).

**PC/VI** is an implementation of the most powerful and most widely used full-screen editor available under the UNIX operating system. The following is only a hint of the power behind **PC/VI**:

- Global search or search and replace using regular expressions
- Full undo capability
- Deletions, changes and cursor positioning on character, word, line, sentence, paragraph, section or global basis
- Editing of files larger than available memory
- Shell escapes to DOS
- Copying and moving text
- Macros and Word abbreviations
- Auto-indent and Showmatch
- MUCH, MUCH MORE!

Don't take it from us. Here's what some of our customers say: "Just what I was looking for!", "It's great!", "Just like the real VI!". "The documentation is so good I have already learned things about VI that I never knew before." — *IEEE Software*, September 1986.

**PC/VI** is available for IBM-PC's and generic MS-DOS† systems for only \$149. Included are CTAGS and SPLIT utilities, TERMCAP function library, and an IBM-PC specific version which enhances performance by as much as TEN FOLD!

# PC/TOOLS™

What makes UNIX so powerful? Sleek. Fast, and **POWERFUL** utilities! UNIX gives the user not dozens, but hundreds of tools. These tools were designed and have been continually enhanced over the last fifteen years! Now the most powerful and popular of these are available for your PC! Each is a complete implementation of the UNIX program. Open up our toolbox and find:

- BFS
- CAL
- CUT
- DIFF
- DIFFH
- DIFF3
- GREP
- HEAD
- OD
- PR
- SED
- SEE
- STRINGS
- TAIL
- WC

All of these for only \$49.00; naturally, extensive documentation is included!

# PC/SPELL™

Why settle for a spelling checker which can only compare words against its limited dictionary database when **PC/SPELL** is now available? **PC/SPELL** is a complete implementation of the UNIX spelling checker, renowned for its understanding of the rules of English! **PC/SPELL** determines if a word is correctly spelled by not only checking its database, but also by testing such transformations as pluralization and the addition and deletion of prefixes and suffixes. For only \$49.00, **PC/SPELL** is the first and last spelling checker you will ever need!

Buy **PC/VI** and **PC/TOOLS** now and get **PC/SPELL** for only \$1.00! Site licenses are available. Dealer inquiries invited. MA residents add 5% sales tax. AMEX, MC and Visa accepted without surcharge. Thirty day money back guarantee if not satisfied! Available in 8", 5¼" and 3½" disk formats. For more information call today!

**"Before I chose Microsoft C,  
I spent 6 months evaluating C compilers  
for my company. Now you can do  
the same in 2 hours."**

*Bill Davidsen  
Software Engineer  
Real Time and Operating Systems*

**"Call us. You can get Microsoft C or  
our comprehensive report on C by  
the day after tomorrow."**

*Bruce Lynch, President  
The Programmer's Shop*

**The security of thorough research.** It took Bill Davidsen six months to thoroughly evaluate all C products before he selected Microsoft C. For him, its tight code and UNIX System V™ compatibility were exactly what he needed. And now Version 4.00 includes CodeView™, a source-level windowing debugger.

Thanks to expert users like Bill, and The Programmer's Shop, you can enjoy that satisfied feeling of thorough product evaluation in just a few hours.

We recommend evaluating software by also getting detailed information from several different sources, including unbiased reports and reviews. Bill agrees completely.

In fact, he helped us compile the objective opinions of 4 magazines, 14 users and 3 industry analysts in a 16-page report on C: *The C Test*. It can help you be absolutely sure of making the choice that's best for you. And it's absolutely free.

**C for yourself.** As an objective evaluation by users and professionals alike, *The C Test* is one of the most comprehensive and informative reports currently available on C development tools. *It's only available from The Programmer's Shop. And it's yours free for the asking.* Here's what you'll find in it:

**The C Test** ■ Detailed Tech Specs  
■ Benchmark Source Code ■ Magazine Reviews ■ Users' Feedback ■ Performance Benchmarks ■ User Study and Profiles ■ Test Drive Survey Results  
■ 37 Compatible Products

And if you're looking for even more C support, Microsoft-compatible libraries for file management, graphics, screen control, object-oriented programming and other tools are ready to ship.

**The best programs for less.** We think the only way to serve you is to give you the best programming alternatives. The best recommendations for your needs. To deliver immediately. And this is how we do it.

We start by giving you a choice of over 62 programming language implementations and 174 support programs. All from the same source. All competitively priced.

Our informed programmers offer free advice whenever you call with any questions about any product.

And when you place an order, we can rush it to you in 48 hours or less. That's the kind of service and support our 10,000 customers have come to expect.

Because we've become a success by giving the best advice for free and selling the best software for less.

**To order Microsoft C (\$279) or for your free copy of *The C Test*, simply call the toll-free number below:**

**1-800-421-8006.** In Massachusetts, call 1-800-442-8070.

## **MICROSOFT C Compiler Version 4.00**

### **MICROSOFT C COMPILER**

- Produces fast executables and optimized code including elimination of common sub-expressions. NEW!
- Implements register variables.
- Small, Medium and Large Memory model libraries.
- Compact and HUGE memory model libraries. NEW!
- Can mix models with NEAR, FAR and the new HUGE pointers.
- Library routines implement most of UNIX System V C library.
- Start-up source code to help create ROMable code. NEW!
- Full proposed ANSI C library support (except clock). NEW!
- Link your C routines with Microsoft FORTRAN (version 3.3 or higher), Microsoft Pascal (version 3.3 or higher) or Microsoft Macro Assembler.
- Microsoft Windows support and MS-DOS 3.1 networking support.

### **MICROSOFT PROGRAM MAINTENANCE UTILITY. NEW!**

- Rebuilds your applications after your source files have changed.
- Supports macro definitions and inference rules.

### **OTHER UTILITIES.**

- Library Manager.
- Overlay Linker.
- EXE File Compression Utility.
- EXE File Header Utility.

### **MICROSOFT CodeView**

### **WINDOW-ORIENTED SOURCE-LEVEL DEBUGGER. NEW!**

- Watch the values of your local and global variables and expressions as you debug.
- Set conditional breakpoints on variables, expressions or memory; trace and single step.
- Watch CPU registers and flags as you execute.
- Debug using your original source code, the resulting disassembly or both intermingled.

**Microsoft C comes with a 30-day money-back guarantee from The Programmer's Shop.**

UNIX System V is a trademark of AT&T Bell Laboratories.  
Microsoft is a registered trademark and CodeView is a trademark of Microsoft Corporation.

## **THE PROGRAMMER'S SHOP**

The programmer's complete source for software, services and answers.

# IF YOU NEED \$5,000 . . . \$20,000 EVEN UP TO \$500,000 TO START A NEW BUSINESS OR TO EXPAND AN EXISTING FIRM—THEN READ WHY YOU TOO WILL CALL THIS INCREDIBLE MONEY RAISING

## BUSINESS OPPORTUNITY SEEKERS' LOANS MANUAL "The Small Business Borrower's Bible"

Practically prepares the loan application for you line-by-line...the "proper" way.

All properly prepared applications are processed faster...no red tape!

\*\*\*\*\*  
EVERY  
LOAN DOLLAR  
YOU GET  
YOU KEEP  
AND USE TO  
OPERATE  
YOUR BUSINESS

### Guaranteed Loans...Direct Loans...and Immediate Loans are available now!

Most men and women seriously interested in starting their own business are eligible to apply — including those who already own a business and need capital fast for expansion...or to stay afloat...even if they've been flatly refused by banks and turned down elsewhere! Yet, too many never qualify, simply because they do not know how to "properly" prepare the loan application...

In order to help those people applying for these guaranteed and direct loans fill out their loan applications the "right way" our business research along with diligent compilation and effective efforts, has successfully assembled and published a comprehensive, easy-to-follow seminar manual: The Business Opportunity Seekers' Loans Manual, that will quickly show you practically everything you'll need to know to prepare a loan application to get federally Guaranteed and Direct Loans.

Here are just some of the many important benefits The Business Opportunity Seekers' Loans Manual provides you with:

- a completely filled in sample set of actual SBA loan application forms, all properly filled in for you to easily follow—helps you in quickly preparing your own loan application the right way. Each line on the sample application forms is explained and illustrated in easy-to-understand language.
- fast application preparation procedures for getting loans for both new start up business ventures and established firms.
- advises you on how to properly answer key questions necessary for loan approval and in order to help avoid having your application turned down—gives you advice on what you should not do under any circumstances.
- what simple steps you take to guarantee eligibility—no matter if you do not presently qualify.
- where you can file your application for fastest processing.

At this point the most important question you want answered is: Just where is all this loan money coming from? Incredible as it may sound—these Guaranteed Loans, Direct Loans...and Immediate Loans are indeed available right now — from the best, and yet, the most overlooked and frequently the most ignored and sometimes outright ridiculed "made-run-of" source of ready money fast capital, in America — THE UNITED STATES GOVERNMENT

Of course, there are those who upon hearing the words "UNITED STATES GOVERNMENT" will instantly freeze up and frown and say

"only minorities can get small business loan money from the government!"

Yet, on the other hand (and most puzzling) others will rant on and on and on that

"don't even try, it's just impossible — all those Business Loans Programs are strictly for the Chryslers, the Lockheeds, the big corporations, not for the little guy or small companies" etc

Still there are those who declare:

"...I need money right now...and small business government loans take too darn long. It's impossible to qualify. No one ever gets one of those loans."

Or you may hear these comments:

"...My accountant's junior assistant says he thinks it might be a waste of my time!" "Heck, there's too much worrisome paperwork and red tape to wade through!"

Frankly — such rantings and ravings are just a lot of "bull" without any real basis — and only serve to clearly show that lack of knowledge...misinformation...and not quite fully understanding the UNITED STATES GOVERNMENT'S Small Business Administration's (SBA) Programs have unfortunately caused a lot of people to ignore what is without a doubt — not only the most important and generous source of financing for new business start ups and existing business expansions in this country — but of the entire world!

Now that you've heard the "bull" about the United States Government's SBA Loan Program — take a few more moments and read the following facts:

- Only 9.6% of approved loans were actually made to minorities last year
- What SBA recognizes as a "small business" actually applies to 97% of all the companies in the nation
- Red tape comes about only when the loan application is sent back due to applicant not providing the requested information...or providing the wrong information
- The SBA is required by Congress to provide a minimum dollar amount in business loans each fiscal year in order to lawfully comply with strict quotas. (Almost 5 billion this year)

Yet, despite the millions who miss out — there are still literally thousands of ambitious men and women nationwide who are properly applying — being approved — and obtaining sufficient funds to either start a new business, a franchise, or buy out or expand an existing one. Mostly, they are all just typical Americans with no fancy titles, who used essentially the same effective know-how to fill out their applications that you'll find in the Business Opportunity Seekers' Loans Manual.

So don't you dare be shy about applying for and accepting these guaranteed and direct government loans. Curiously enough, the government is actually very much

- **GUARANTEE #1**  
Simply — look over this most effective money raising loan preparation assistance manual for 15 days — and, then, if you are not convinced that it can actually help you obtain the Business Loan you need right away — just return it for a full and prompt refund

interested in helping you start a business that will make a lot of money. It's to their advantage — the more money you make the more they stand to collect in taxes. In fiscal 1986, our nation's good old generous "uncle" will either lend directly or guarantee billions of dollars in loan requests, along with technical assistance and even sales procurement assistance. Remember, if you don't apply for these available SBA funds somebody else certainly will.

Don't lose out — now is the best time to place your order for this comprehensive manual. It is not sold in stores. Available only by mail through this ad, directly from Financial Freedom Co., the exclusive publisher, at just a small fraction of what it would cost for the services of a private loan advisor or to attend a seminar.

For example:

Initially, this amazing Guaranteed and Direct Loans Manual was specially designed to be the basis of a Small Business Loan Seminar — where each registrant would pay an admission fee of \$450. But our company felt that since the manual's quality instructions were so exceptionally crystal-clear that anyone who could read, could successfully use its techniques without having to attend a seminar or pay for costly private loan advisory assistance services.

Therefore, for those purchasing the manual by mail, no 3 day class, no course and accommodations are required. And rather than \$450 we could slash the price all the way down to just a mere \$20 — a small portion of a typical seminar attendance fee — providing you promptly fill in and mail coupon below with fee while this special "seminar-in-print" manual offer is still available by mail at this relatively low price!

Remember, this most unique manual quickly provides you with actual sample copies of SBA Loan application and all other required forms—already properly filled in for you to easily use as reliably accurate step-by-step guides—thus offering you complete assurance that your application will be properly prepared, and thereby immediately putting you on the right road to obtaining fast no red-tape loan approval

- **GUARANTEE #2**  
Even after 15 days — here's how you are still strongly protected — if you decide to keep the manual — and you apply for an SBA Loan anytime within 1 year your loan must be approved and you must actually receive the funds or your money will be refunded in full

Only because we are so confident that this is a fact do we dare make such a strong binding seldom-heard-of Double Guarantee. No stronger guarantee possible!

Of course, no one can guarantee that every request will be approved—but clearly we are firmly convinced that any sound business request properly prepared—showing a reasonable chance of repayment and submitted to SBA—will be approved.

**THOUSANDS ARE PROPERLY APPLYING AND BEING APPROVED. HERE'S YOUR CHANCE TO JOIN THEM!**

### FREE BONUS

If you order your manual today you'll receive a valuable treasury of fast, easy, low-capital and highly profitable business programs worth forty-five dollars — yours absolutely free!

100% tax deductible as a business expense. Don't delay — order your copy today!

### NO RISK LOAN OPPORTUNITY FORM

Detach and rush for COMPLETE PREPARATION ASSISTANCE FOR LOAN APPROVAL

Please rush me \_\_\_\_\_ copies of "Business Opportunity Seekers' Loans Manual" each at a \$20 fee plus \$3.00 handling and shipping. I am fully protected by the two strong guarantees above. I'm ordering today — so I can receive FREE — the valuable treasury of fast, easy, low-capital and highly profitable business programs — worth forty-five dollars — mine free to keep even if I decide to return the manual for a full refund.

# Did Santa Forget You?

## Treat Yourself and Save

**STAY-RES**—Make Compiled BASIC\* Programs Memory-Resident. Shell any program—even BASIC!

Can use LIM expanded memory or RAM disk for program swapping (requires DOS 3+ and our EMS/RAM disk module). Invoke your program with a "hot key" or a POKE from another program. Protects you from calling DOS functions at unsafe times. Automatic screen save/restore in text or MONO/CGA graphics modes (including EGA, Hercules). More than one program can be co-resident. Enables you to perform multi-tasking with BASIC. Compatible with any well-behaved program and most not-so-well behaved ones. \$95. EMS/RAM disk module \$50. Demo available.

**MACH 2**—Ultra-fast, Extensive Assembler Subroutine Library for BASIC\*

Our assembler subroutines give your programs a crisp, professional look and feel. Display data instantly when compiled. Window manager. Store, sort, search string data using all available DOS memory—no more 64K limit. Controlled input routine allows full use of standard editing keys & ignores Ctrl-C and Ctrl-Break. Change screen attributes without re-displaying text. Read/write files FAST as DOS. PRINT USING for numbers up to 6 times faster than BASIC. Number rounding. DOS/BIOS function calls & interrupts. Many more functions. Source code available. Demo available. No assembler or knowledge of assembler programming is required. \$75

**PEEKs 'N POKES**—Get More out of the IBM PC Family\*

Read & change system configuration. Read your CMOS chip on AT class machines. Unprotect GW-BASIC, BASIC, BASICA programs saved with "P". Read & change keyboard status. Plug characters into keyboard buffer. Read printer, COM and video status. Swap monitors, COM ports and printers. Generate more and better sounds than BASIC. Find more PEEKs & POKES. Tutorials on binary & HEX numbers, DEF SEG, Port, INP, OUT, logical operators. Boot your system three different ways from BASIC. Many more functions. Most source code included. \$45

**THE INSIDE TRACK**—Programmer's Utilities & Starter Assembler Routine Library for BASIC\*.

Control keyboard shift status from DOS or your program—force CAPS lock, NUM lock, etc. Keep diskette motor running for better throughput. Copy protect a diskette. Boot your system three different ways from DOS. Duplicate one monitor's contents on the other monitor. Load & execute large EXE files faster than DOS, from DOS or compiled BASIC. Limit memory used by compiled BASIC programs to avoid reloading Command.com. Send ANSI control characters to screen in any compiled BASIC. Memory map and BIOS call reference chart, including EGA calls. All source code included. Many more functions. \$65

# A Message-Passing Executive

*Although it is a realtime operating system first, QNX derives its real strength from its ability to infuse realtime executive power and control into networking situations.*

GARY ELFRING

The development of software usually involves a number of trade-offs during design. Each product ultimately reflects the elements its designer considers to be most important (or perhaps most marketable). Realtime executives, for example, typically are designed to deliver blazing speed. Finding the best executive for an application generally involves evaluating the optimal combination of speed and price—with disk/file control and networking ability often taking a back seat. The problem with this approach is that speed is not always the sole, or even the best, criterion for selecting a realtime operating system.

The major task of any realtime executive always has been to monitor a number of input signals and to produce some output based on those inputs within a limited amount of time. As computers become faster and less expensive, the number of features available (and indeed often demanded by users) in a typical executive has increased dramatically. It now has become feasible to build realtime control systems that require networks of PCs operating concurrently.

Imagine, for example, a factory that produces a cornflakes cereal. The various ingredients that go into the cornflakes must be mixed, then baked in an

oven. This mixing-and-baking process would be under the control of one PC. The PC also must control the furnace temperature for baking. Once baked, the cornflakes must be put into boxes. A second PC would monitor and perform limited control functions on a group of filling machines. Finally, all the cornflakes boxes must be weighed. A series of check-weighing machines would operate under the control of a third PC. These devices would reject cereal boxes that are too light. The PC monitors the operation of the check weighing machines, but it does not actually control them.

Each of these three PCs must perform several different realtime control functions. The tasks are sufficiently complex that to integrate all functions into just one PC would be impossible. However, information from each control system must be available to the other two PCs. Some type of operator alarm system also must be provided that would alert maintenance personnel to problems with cereal box weight. (If cornflakes boxes are consistently too heavy or too light, the problem may be with the filling machine, or it may involve the cornflakes themselves. In that case, adjustment would have to be made to the baking process.)

Designing a networked realtime system to perform these functions presents some difficulties. The first requirement is a realtime database. This database must supply a form of record-locking to keep separate operators or machines from simultaneously changing the same piece of information. Then, the system needs all three computers to operate in realtime, yet to remain simultaneously linked or synchronized. The executive that is chosen must be able to initialize the entire system at once and to pass messages from a task in one machine to a task in another. In addition, tasks running in one machine should be able to exert some control over tasks in the other two; thus, the tasks in each machine must interact with each other in realtime.

QNX, a realtime operating system from Quantum Software Systems Ltd., is designed to handle just this kind of situation. QNX provides a multiuser, multitasking, multiprocessor, realtime environment for the development and execution of an application. Reviewed here specifically are QNX versions 1.2 (stand-alone) and 2.0 (networked).

QNX runs on the PC, PC/XT, PC/AT, and compatibles. Most standard PC devices are supported, including the IBM Enhanced Graphics Adapter and En-

**FIGURE 1:** *Typical Realtime Executive Structure*

Most realtime executives can be visualized as a kernel surrounded by various system managers. An application code task then surrounds this nucleus.

hanced Color Display. The operating system requires approximately 100KB of memory to load and bring up a shell; a minimum of 192KB is needed for a single-user system. Running commands in the background or support of additional users requires 256KB or more.

Although QNX is not DOS-compatible in file structure or system call format, a program is available that lets the user read and write DOS files; another program runs DOS as a task on the AT. When running on an AT or compatible, QNX can operate in either the real or the protected mode of the 80286. When in protected mode, however, as much as 15MB of memory may be used. In this mode, DOS emulation is supported only for the IBM AT and the Compaq Deskpro 286.

QNX provides a rich UNIX-like operating environment for developing realtime application programs. Yet, it is not another version of UNIX and, in fact, contains no AT&T code. QNX is designed to handle realtime applications. It offers a true message-passing architecture with full network support.

#### **STRUCTURAL DIVERGENCE**

The internal structure of QNX is significantly different from that found in many realtime executives. Most others can be

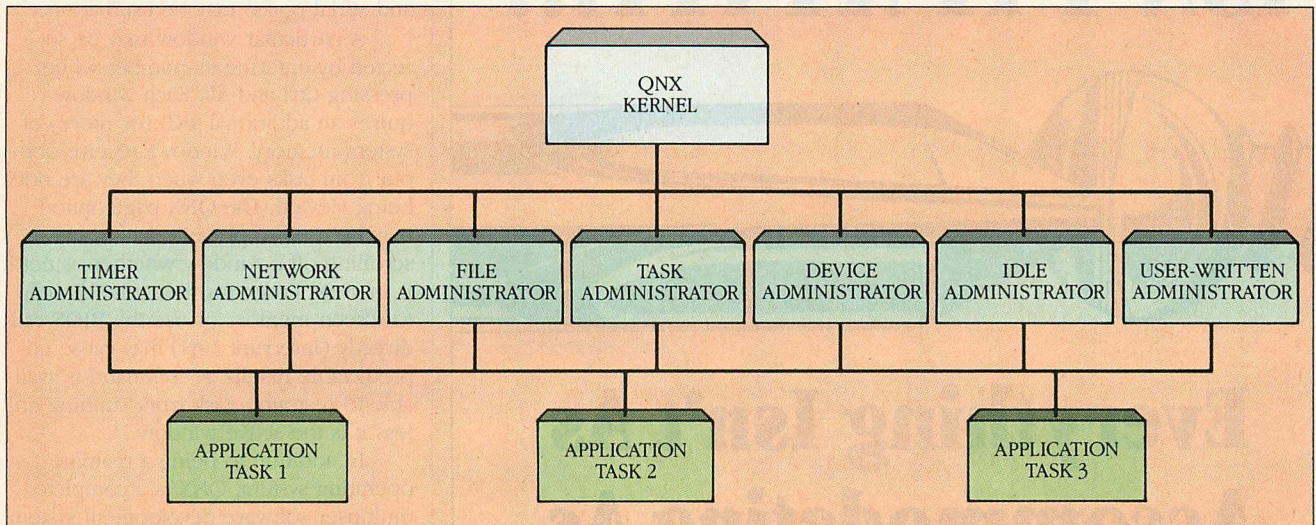

visualized as a circular kernel surrounded by various system-level managers; application tasks then surround this nucleus, as shown in figure 1.

QNX does use a small kernel for its most basic operations, but the similarity to other executives ends there. Under QNX, most hardware management and, indeed, a great many of the executive's realtime functions, are performed by *system administrators*, which are simply tasks running under the operating system kernel that provide specific operating system functions; most are supplied by tasks that can be augmented easily by user-written tasks. This approach does not require the source code to QNX to make major changes in the way it operates. This can be advantageous in attempting to customize an executive for a specific application. Figure 2 is a diagram of the QNX system architecture.

QNX was designed as a message-passing operating system. Unlike most realtime executives, which pass pointers to messages between tasks, QNX passes the entire message from task to task. The QNX approach is considerably slower than the other, but it has advantages. Because entire messages are passed, it does not matter to the executive if the tasks reside in the same or a

**FIGURE 2:** QNX Realtime Executive Structure

QNX has a small kernel for its most basic operations. System administrator tasks perform specific operating system functions.

different machine. Thus, true networked realtime control becomes possible. A task that wants to pass a message to another task does not need to know in which system that task resides; networked communications are relatively transparent to individual tasks.

However, this architecture has a serious impact on the speed with which the QNX operating system can run. On a 6-MHz AT running in real mode, QNX can schedule a task to run in about 476 microseconds; in protected mode, this operation takes 612 microseconds. Although this may seem reasonably quick, it tells only half the story. All realtime systems must perform some kind of intertask communications. But in a full message-passing environment, these communications are inherently and considerably slower than in executives, which do not pass entire messages.

The QNX operating system comprises two major elements. The basic kernel provides a fixed minimum set of services, including message forwarding, clock interrupt handling, and virtual circuit management. All other features of the system are under the control of standard administrators. Additional administrators may be added as needed.

The task administrator (task ID 0001) is responsible for all basic task control functions, including creating or destroying tasks. If a task needs information about another task, it can interrogate the task administrator to obtain the other task's current status. The task administrator also performs some memory management functions.

The file administrator (task ID 0002) controls all access to and from

the QNX drives, including diskette, hard, and RAM disk. The basic file structure and access methods are defined by this administrator. The QNX-supplied administrator provides a tree-structured method of disk access very similar to, but not compatible with, that supplied by DOS or UNIX. Like DOS and UNIX, QNX supports a simple method of file sharing that is adequate for many applications. It will not, however, be adequate in situations where concurrent tasks must read *and* write from disk files. For this situation, the user will need to write a new administrator.

The responsibility for control of all serial devices in a system falls with the device administrator (task ID 0003). Typical serial devices include terminals, modems, and printers. The actual drivers needed to access the serial ports are contained in this administrator. These drivers typically provide all device-specific control functions; for example, all code for an XON/XOFF protocol would reside here. Thus, the serial device administrator isolates tasks from most aspects of device control.

Accounting for all idle time in the system is the idle administrator (task ID 0004), which is also the default owner of all child tasks that must run after the death of a parent task. (Some portion of program code must be running at all times; an idle administrator serves to soak up all free time.)

The network administrator (task ID 0005) controls all access to and through the QNX network. Its use is optional because QNX does not require a network to run. This administrator manages all the network aspects of virtual

circuit control and message passing (explained below); it also can boot other machines (or *nodes*) onto the network by passing a start-up code to them. (QNX nodes are networked using an implementation of Datapoint's ARCNET. The network uses a token-passing scheme and operates at 2.5 megabits per second. A QNX networking board is required for each node, and stations are connected using RG62U coaxial cable. A passive hub can be used to connect up to four stations; an active hub is required for larger configurations.)

The timer administrator (no fixed task ID) is responsible for all task-related timing functions. It provides time control and alarm functions for tasks requesting such operations. Use of the administrator is optional.

Typically, an administrator task is written as a loop that first receives a message. The ensuing code generates a specific action for each possible message case that the administrator might receive. The loop ends when the administrator replies to the message. User-written administrators never use the SEND function because this would keep the administrator from operating, pending a reply. All administrators should run at a higher priority than any task that uses that administrator.

### A FERTILE ENVIRONMENT

QNX can support several full-screen windows on the PC display. Windows may be assigned to different tasks or to the same task. One window is available when the system's initial program is loaded; others may be opened using the MOUNT command. A maximum of

# ISN'T IT A PITY...

## Everything Isn't As Accommodating As

**c-tree**<sup>TM</sup> / **r-tree**<sup>TM</sup>  
FILE HANDLER / REPORT GENERATOR

### Performance and Portability

For all the time you devote to developing your new programs, doesn't it make sense to insure they perform like lightning and can be ported with ease?

### c-tree: Multi-Key ISAM Functions For Single User, Network, & Multi Tasking Systems

Based on the most advanced B+ Tree routines available today, **c-tree** gives you unmatched keyed file accessing performance and complete C Source Code. Thousands of professional C programmers are already enjoying **c-tree's** royalty-free benefits, outstanding performance, and unparalleled portability.

Only FairCom provides single and multi-user capabilities in one source code package, including locking routines for Unix, Xenix, and DOS 3.1., for one low price! In addition, **c-tree** supports fixed and variable record length data files; fixed and variable length key values with key compression; multiple indices in a single index file; and automatic sharing of file descriptors.

### r-tree: Multi-File Report Generator

**r-tree** builds on the power of **c-tree** to provide sophisticated, multi-line reports. Information spanning multiple files may be used for display purposes or to direct record selection. You can develop new reports or change existing reports without programming or recompiling and can use any text editor to

create or modify **r-tree** report scripts including the complete report layout. At your option, end users may even modify the report scripts you provide.

### Unlimited Virtual Fields; Automatic File Traversal

**r-tree** report scripts can define any number of virtual fields based on complex computational expressions involving application defined data objects and other virtual fields. In addition, **r-tree** automatically computes values based on the MAX, MIN, SUM, FRQ, or AVG of values spread over multiple records. **r-tree** even lets you nest these computational functions, causing files from different logical levels to be automatically traversed.

Unlike other report generators, **r-tree** allows you to distribute executable code capable of producing new reports or changing existing reports without royalty payments, provided the code is tied to an application. Your complete source code also includes the report script interpreter and compiler.

### How To Order

Put FairCom leadership in programmers utilities to work for you. Order **c-tree** today for \$395 or **r-tree** for \$295. (When ordered together, **r-tree** is only \$255). For VISA, MasterCard and C.O.D. orders, call 314/445-6833. For **c-tree** benchmark comparisons, write FairCom, 2606 Johnson Drive, Columbia, MO 65203.

## Complete C Source Code & No Royalties!

Xenix is a registered trademark of Microsoft Corp. Unix is a registered trademark of AT&T.

CIRCLE NO. 119 ON READER SERVICE CARD

## QNX

13 windows and standard devices (including the PC display, line printers, and serial ports) may be used at once.

A particular window may be selected by entering its number while pressing Ctrl and Alt. Each window requires an additional 4KB (or more) of system memory. Windows receive output from tasks even when they are not being viewed. The QNX page option may be used to prevent data from scrolling off a window whether or not it is in view. Programs that write directly to screen memory or use the BIOS calls directly (interrupt 10H) may cause unpredictable results. A command is available to restrain a task from running unless it is the active window.

In addition to being a realtime operating system, QNX is a complete multiuser software development system. It supports as many as 11 users on each PC; one user may access QNX through the PC while the others use terminals. Most QNX utilities and applications are designed to be device-independent and thus do not require the PC display to perform. Because QNX supports high-speed networks of PCs, very large networks can be developed to support hundreds of users.

System security is provided in this system with PASSON, a command that restricts access to designated files to individuals with a valid user ID and password. A programmer can define a list of valid users for a given application, thus possibly eliminating the need for security routines. This type of security often is necessary to both multiuser systems and realtime applications.

QNX offers a variety of specialized utilities. A RAM-disk driver is available, as are an electronic mail system (MAIL) and an appointment scheduler (AP). All QNX utilities work on either individual or networked systems.

The system combines two different approaches to produce one uniform environment. QNX is a true realtime operating system; at the same time the QNX file system is UNIX-like, offering full tree-structured directories, similar file-naming conventions, data security, and a program development environment that resembles UNIX closely. (As noted, the QNX operating system and files are neither DOS- nor UNIX-compatible.)

QNX boasts a rich variety of commands, the majority of which, in spite of their not being compatible, are similar in format to their UNIX counterparts. Commands are available to: list and dump directories and files, edit files, manipulate directories and files, move files, execute disk utilities, handle

# Unleash The Most Powerful Development Tools On The Planet DOS.

## UNIFY DBMS/DOS. The UNIX World Leader Brings A New Dimension To DOS Application Development.

What happens as the DOS world expands? As a new generation of hardware takes over? As networking becomes more important? The potential is enormous. But until now, the tools to achieve it have been limited.

Now a leader from another world unleashes that potential: UNIFY® DBMS. The leading relational DBMS in the UNIX™ world. And now, the most advanced set of application development tools in the DOS world.

With UNIFY DBMS, DOS developers have new power to build more sophisticated applications than ever before possible.

The power to write high performance "C" programs that will access the data base, using Unify's Direct Host Language Interface.

The power of an industry standard query language—SQL.

The power of unmatched speed in production applications. Only UNIFY DBMS is specifically engineered for transaction throughput. With unique performance features like PathFinder™ Architecture multiple access methods, for the fastest possible data base access.

The power of comprehensive program development and screen management tools. Plus a state-of-the-art fourth generation report-writer.

What's more, with UNIFY DBMS, the potential of networked applications becomes a reality. Unlike DBMS systems which were originally single-user (and which have a long stretch to accommodate more users), UNIFY DBMS is a proven multi-user system.

And because UNIFY DBMS/DOS is the best of two worlds, it offers you the most powerful benefit of all: DBMS applications that can grow as your needs grow. From single user DOS. To networked DOS. To multi-user UNIX. All without changing your applications.

New Version 2.0

## Complete C Programs in Half the Time, with *Instant-C*™

**Y**ou can create programs much faster with *Instant-C* than with conventional programming tools. How? Because *Instant-C* is a high-performance interpreter, there are **no compile or link delays**. Change your program, then test it immediately. No matter how large your program, the turnaround time is just seconds.

"Instant-C means instant gratification."—*PC Magazine*, **Editor's Choice** for best C interpreter. 10/29/85

Powerful **source-level debugging** saves your time. Conditional breakpoints, single-stepping by statement, source code backtraces, data monitoring, and many other debugging features make it easy to wipe out bugs quickly. Direct execution of any statement or function makes testing a breeze.

"The resulting debugging and testing capabilities are fantastic and the detailed trace/debug/display commands make it easy."—*The C Journal*, Summer/85

*Instant-C* checks pointer references for reasonableness, and checks that array indexes are within declared bounds. This **run-time checking** stops your program as soon as errors occur, for easiest debugging.

Not only does *Instant-C* help you quickly change, test, check and debug your code, but it runs your program **fast enough for real-time** applications.

"It is much faster than any of the other products mentioned and was the only one able to complete the standard SIEVE in a reasonable time. Clearly, this high speed allows much more complex problems to be attacked with *Instant-C* than with any of the other products discussed."—*Computer Language*, 2/86

Immediate feedback and precise diagnostics make *Instant-C* great for learning C. Full K&R and the ability to **link compiled object code and libraries** (Lattice and Microsoft) makes *Instant-C* compatible with your existing programs.

*Instant-C* makes all parts of the programming task as fast as possible.

"Clearly, *Instant-C* is the performance champion."—*PC Tech Journal*, 5/86

Version 2 works with MS-DOS and PC-DOS, and has a full 31 day **money back guarantee**. *Instant-C* is only \$495. Order today! Call or write for full information.

rm	split	tcap		
rmdir		who		
ws				
zap				

Although QNX is not a UNIX system, many of QNX's large assortment of commands are similar in format and function to corresponding UNIX commands.

information, use the QNX network, communicate over modems, and perform various tasks specific to the QNX environment. Table 1 lists the major QNX operating system commands.

The QNX utilities with standard UNIX counterparts include **cd** (change the current directory), **ls** (list a directory), **mkdir** (make a new directory), and **rm** (remove a directory). QNX offers two different text editors: **ed** is a full-screen editor, **led** a line-oriented editor. Two other programs, **arch** and **backup**, perform the archiving of programs to diskette or tape or back up to diskette, respectively. **Crypt** provides encryption/decryption functions for sensitive files, and, finally, **comm** and **talk** permit communications over modems and to mainframes, respectively.

In addition to operating system utilities, QNX establishes a full-featured realtime programming environment for the C language. A complete C compiler, library, linker, and assembler come standard. The C compiler offers most of the standard extensions to C made popular by recent versions of UNIX; it requires two passes to produce an assembly language source module, which then must be assembled and linked to generate an executable program. A standard **MAKE** utility is provided.

The QNX C library provides specialized functions for realtime control, networking, and 8086 or 80286 support. It is a powerful programming tool. The

library is *shared*, in that only one copy of the standard library is resident in QNX at any one time. C programs do not include a copy of the library functions that they use (DOS-developed programs, for example, do).

The shared library is a function module that is loaded into program memory using **MOUNT**. Once a library is mounted, it remains resident in QNX until the system is rebooted. As long as a shared library is mounted, any task can access the functions in the library through a software interrupt. This technique keeps program size to a minimum, thus saving precious memory.

Under QNX, programmers may create their own libraries for program tasks. In general, QNX shared libraries must be reentrant. In C, this means that global variables or any static variables to which functions write cannot be used; static variables may be used in a read-only manner. Essentially, the goal is for all local data storage for the function to come from the stack. In compiling the modules for a shared library, the stack-checking code option of the compiler should be turned off. The shared library also must be patched, using the **PATCH** command, to change its type. A shared library usually contains only executable functions. Occasionally, it may contain a data table, but such a table must never be written to because record-locking features are not available in shared libraries.

# A Hard Look at LAN Choices.

## Novell's LAN Report Package makes choices easier.

The flexibility of local area networks allows users to assemble LANs using network components that best suit the needs of the installation. But choosing those components can be a confusing process.

Novell, Inc., has published two reports designed to make the process easier: the *LAN Operating System Report 1986* and the *LAN Evaluation Report 1986*.

These reports help users evaluate network components and make informed decisions when choosing the components that meet their needs. Hardware and software issues are separately evaluated in the two reports, and extensive performance benchmarks are included.

### Software Choices.

Choosing a network operating system, or LAN software, is the most critical aspect of designing a network. Simply, the better the operating system, the better the network. The *LAN Operating System Report* contains an in-depth analysis of LAN software, beginning with an examination of LAN software standards such as MS-DOS 3.1 and NETBIOS, and the file server environment. Issues like internetworking, system reliability, security and performance are addressed as well.

The *LAN Operating System Report* also evaluates Novell Advanced NetWare, the IBM PC Network Program and 3Com 3+. The report shows users how the design and implementation of these products translates into real performance.

### Hardware Options.

The *LAN Evaluation Report 1986* focuses on evaluating network hardware. It examines hardware issues that affect LAN performance, including an analysis and benchmarking of major LAN products.

- Standard Microsystems ARCNET
- 3Com EtherLink
- 3Com EtherLink +

The report analyzes each NIC according to its access scheme, raw bit-rate, on-board processor and NIC-to-host transfer method.

**"Hardware and software issues are separately evaluated in the two reports..."**

Another important component of the LAN is the network server. In examining network servers, the *LAN Evaluation Report* looks at several performance indicators. Processor type is the most obvious feature to differentiate servers. However, other factors important in determining server performance are also evaluated, including processor clock cycle speed, wait states, server memory cycle speed, memory channel and transfer bus channel. And the report examines the effect of disk channel speed on

network performance.

In addition to providing a careful examination of LAN hardware, the *LAN Evaluation Report* features an evaluation formula. Using the formula, a LAN's estimated future site activity is measured and matched to the appropriate LAN hardware.

### To Get the Reports.

The *LAN Operating System Report 1986* and the *LAN Evaluation Report 1986* are available free of charge from Novell. To obtain a copy of the Novell Report Package, call or write Novell Corporate Communications, 748 North 1340 West, Orem, Utah 84057, (801) 226-8202.

 **NOVELL**

Besides C, QNX supports compiled BASIC, FORTRAN, and Pascal (as optional components at additional cost). All object modules follow the same format so that modules compiled from different languages may be mixed, provided attention is paid to the way in which arguments are passed.

### TASKS AND SCHEDULING

Under QNX, a task is simply a small program designed to accomplish a single objective. As is the case with most realtime executives, QNX makes it ap-

pear as though a number of different program tasks are running concurrently on a PC. The operating system accomplishes this by switching very quickly among separate tasks. QNX defines the relationship among tasks running under it as follows: a parent task is an original task started from a terminal; a child task is created by a parent. In general, when a parent task dies or is terminated, all of its child tasks also are terminated.

Tasks that are not blocked will be run on the basis of an associated priority assigned to each QNX task. Task

priority can range from 1 (the highest) to 15. In the off-the-shelf QNX package, priority 1 is reserved for the task administrator, and priorities 2 and 3 are reserved for other QNX administrators. Thus, the highest priority that can be assigned to a user task is 4. User tasks must not compete with the QNX administrator task for processor time.

Any task may create child tasks. One of three relationships will result, depending upon the assigned priority. If a task creates a child task of higher priority, the child runs to completion before control is returned to the parent (the parent task is suspended until the child task completes). This feature is used chiefly in special situations. For example, a communications task might detect an important message that must be answered before any further actions can be taken. A high-priority child task could be created that would answer the message, then return control to its parent. If a child process is created with the same priority as the parent, the two execute concurrently. Finally, a parent may create a child task of lower priority that executes when the parent becomes blocked for any reason. A child process (of lower priority) also may be created that continues to run even after the parent dies. Such a child process might perform some form of clean-up of hardware or software functions.

In connection with the QNX support of a realtime networked system, tasks refer to other tasks running on different nodes as *virtual tasks*. A virtual task runs concurrently with all tasks in other nodes. (Because the tasks reside in different machines, they actually do execute in parallel and simultaneously.) Any task can create a child process on another node by communicating over the network to the task administrator of the other node. The status of the child process depends upon the current status of the virtual tasks resident in that node. Tasks running on different nodes can communicate with each other.

QNX provides three separate task creation functions (as part of its C library): CREATE, FORK, and SHELL. The CREATE function lets the user construct a new task on any node in the QNX system. Along with the priority assignment for the new task, an optional list of arguments may be passed to the task when it is started. FORK creates an exact duplicate of the current task (the new task is the child of the task that issues the FORK command). Both tasks share the same priority and code segment, but not the same data segment. Finally, SHELL creates a new task by

## THE ATRON BUGBUSTERS BRING HARDWARE BREAKPOINTS TO MICROSOFT'S CODEVIEW

You already have MicroSoft's CodeView.™ And you've seen our ads for the Atron hardware-assisted software debuggers. Right? You know, the Atron *Bugbusters*? We make the debugging tools used by 9 of the top 10 software developers in the PC market. Now, with our new MiniProbe™ shortcard, you can use your familiar *watchpoints* and *tracepoints* in real time. Without learning new debugging technology.

device. This solves the most common debugging problem: Out-of-range pointers which overwrite the program code or data. Often, the overwrite is different after each new compile of the program.

The MiniProbe can also set a hardware breakpoint over a range of memory locations, helping to trap uninitialized pointers. And MiniProbe has a crash-recovery switch box, which lets you regain control of a frozen system.

**Only \$395 puts  
you into world-  
class debugging.**

With real-time watchpoints and tracepoints, a one-minute program will run in one minute. Not 50 hours (the difference between software-only debuggers and hardware-assisted debuggers is a 3000-to-1 increase in efficiency). And if the program bug you're trying to find has anything to do with interrupt activity, it might *never* occur when you're debugging with CodeView alone.

But with the Atron MiniProbe, you can trap events like reading and writing to memory or an IO

**So now that you don't  
have to learn a new  
debugger, the only thing  
keeping you from  
debugging like the pros is  
\$395. And our phone  
number: 408/741-5900.  
Call today. Bust bugs, and  
records, tomorrow.**

## QNX: With any other OS, your personal computer is asleep at the switch.

If real-time performance is the key to the next generation of small systems, task-switching is the key to real-time performance.

QNX task-switching has been measured using standard Intel benchmarks. Here are the results:

OS	Computer	Processor	Task Switches/Sec
QNX™	IBM AT	8Mhz 80286	2800
QNX™	IBM PC	5Mhz 8088	787
XENIX™	Intel-286	5Mhz 80286	203
UNIX™	CODATA	8Mhz 68000	187
XENIX™	ALTOS	5Mhz 8086	96
UNIX™	FORTUNE	6Mhz 68000	95

The margin by which QNX outperforms UNIX-based systems is not accidental. QNX architecture is unique among multi-tasking small computer operating systems because it is modular, not monolithic. On the PC, this distinction is decisive: UNIX system overhead and processing demands sap any computer smaller than an AT.

Because QNX was developed specifically for smaller computers, not "kluged" from an OS written for larger computers, its structural advantages are apparent. QNX was the first multi-tasking, multi-user OS for the IBM PC (1982), the first again for the AT (1984) and the first networking OS for the PC and the AT (1984). For the foreseeable future,

QNX will remain the only real-time multi-user, multi-tasking OS for the PC, the AT and compatibles.

As a networking OS, only QNX provides integrated performance at the fundamental level of inter-task communications. The tasks need not be on the same machine: the messaging is network-wide.

A task responsible for handling an A/D converter on one machine can provide data and accept requests from tasks on any other machine. For this reason only QNX can

implement true distributed processing, distributed file systems and distributed devices, with no need for a central file server.

Since QNX is modular, programmers can easily adapt and enhance the OS itself by adding their own system task. PC-DOS 2.1 or 3.1™ can run as one of QNX's many tasks.

With over 20,000 QNX systems installed worldwide, QNX is the undisputed standard for real-time microprocessor applications.

<b>Multi-User</b>	10 serial terminals per PC, AT.	<b>C Compiler</b>	Standard Kernighan and Ritchie.
<b>Multi-Tasking</b>	40 (64) tasks per PC (AT).	<b>Flexibility</b>	Single PC, networked PC's, single PC with terminals, networked PC's with terminals. No central servers. Full sharing of disks, devices and CPU's.
<b>Networking</b>	2.5 Megabit token ring. 255 PC's and/or AT's per network. 10,000 tasks per network. Thousands of users per network.	<b>PC-DOS</b>	PC-DOS runs as a QNX task.
<b>Real Time</b>	2800 task switches/sec (AT).	<b>Cost</b>	From US \$450. Runtime pricing available.
<b>Message Passing</b>	Fast intertask communication between tasks on any machine.

New Features

# Windows, Data Entry, Help Management, Menus, Text Editing, plus ...

## SOURCE CODE

# Vitamin C

*It's good for your system!*

### The Vitamin C Difference

With **Vitamin C**, your applications come alive with windows that explode into view! Data entry windows and menus become a snap, and context sensitive pop-up help messages are nearly automatic.

With **VCScreen**, you'll save time by interactively painting windows and forms so what you see is what you get! Then, one button generates C source code ready to plug into your program and link with Vitamin C.

Easy enough for the beginner. Versatile enough for the professional. Vitamin C's **open-ended design** is full of "hooks" so you can intercept and "plug-in" special handlers to customize or add features to most routines.

Of course, Vitamin C **includes all source code FREE**, with no hidden charges. *It always has.* That means you'll have everything you need to adapt to special needs without spending hundreds of dollars more.

### Windows

**Create as many windows as you like** with one easy function. Vitamin C automatically takes care of complicated tasks like saving and restoring the area under a window.

Options include titles, borders, colors, pop-up, pull-down, zoom-in, 4-way scrolling, scroll bars, sizes up to 32k, text file display & editing, cursor display, and more.

Unique built-in feature lets users move and resize windows during run-time via a definable key.

Access the current window by default or a specific window any time, even if it's hidden or invisible. Save and load windows on disk for more versatility!

### Data Entry

**Flexible dBase-like data entry** and display routines feature protected, invisible, required, and scrolling fields. Picture clause formatting, full color/attribute control, selection sets, single field and full screen input, and unlimited data validation via standard and user definable routines. That means you aren't locked into one way of doing things.

Vitamin C even provides true right-to-left input of numeric fields with dynamic display of separators & currency symbols.

### High Level Functions

Use our integrated help management, multi-level menus, and text file routines, or build your own handlers using Vitamin C's basic windowing and data entry routines.

**Standard help handler** provides context sensitive pop-up help messages any time the program awaits key strokes. The help text file is stored on disk and indexed for quick access. So easy to use that a single function initializes & services requests by opening a window, locating, formatting, displaying, and paging through the message.

**Multi-level "MacIntosh" & "Lotus" style menus** make user interfaces and front ends a snap. Menus can call other menus, functions, even data entry screens, quickly and easily.

**Text editor windows** can be opened for pop-up note pads, memo fields, or general purpose editing. Features include insert, delete, word wrap, and paragraph formatting.

## VCScreen

### Screen Painter/Code Generator

Just as Vitamin C's reusable functions speed your programming, VCScreen makes it even *faster and easier* by automatically generating C source code for your data entry screens!

With VCScreen's interactive screen editor, you actually draw your forms. You can define input, output and constant fields, headings, boxes, lines and even a window for the form to run in.

What you see is what you get. If you don't like the position of an object, just "pick it up" with the cursor and move it! Changing colors, attributes, copying, and deleting is just as easy.

VCScreen generates readable C source code. It declares variables with names you provide and can even generate structures.

With VCScreen choosing the right functions, parameters and sequences, and Vitamin C supplying the functions to choose from, you can stop worrying about semi-colons, matching braces, and calling conventions and concentrate on creating your application!

## 30 Day Money Back Guarantee

Better than a brochure. More than a demo disk. If you're not satisfied, simply return the package within 30 days and receive a full refund of the purchase price.

**Vitamin C ..... \$225.00**

*Includes ready to use libraries, tutorial, reference manual, demo, sample, and example programs, and quick reference card. For IBM PC and compatibles. Specify Microsoft, Lattice, Computer Innovations, Aztec, Mark Williams, Wizard, DeSmet, or Datalight C compiler AND compiler version number when ordering.*

**Vitamin C Source ... FREE\***

\*Free with purchase of Vitamin C

**VCScreen ..... \$99.95**

*Requires Vitamin C and IBM PC/XT/AT or true compatible.*

### ALL ORDERS:

**SHIPPING:** \$3 ground, \$6 2-day air, \$20 overnight, \$30 overseas. Visa and Master Card accepted. All funds must be U.S. dollars drawn on a U.S. Bank. Texas residents add 6% sales tax.

PROGRAMMING

Creative Programming Consultants, Inc.  
Box 112097 Carrollton, Texas 75011

parsing a passed string, an action equivalent to entering a command into the operating system shell. Thus, a task can invoke system commands as if they were entered from a terminal.

Task scheduling is handled differently under QNX than under most real-time executives. QNX follows a preemptive, time-sliced, priority-based method in which task preemption takes place instantaneously rather than at the end of a clock tick. For example, when a task of higher priority is scheduled, the very act of scheduling the higher task causes it to be run immediately before control is returned to the parent. Tasks of the same priority run in a time-sliced arrangement: the number of clock ticks allowed for each task can be set using SET\_SLICE. Control among tasks of the same priority is handled on a round-robin basis; however, tasks are always executed in the same order in which they were originally scheduled.

This time-sliced scheduling of tasks gives QNX an important advantage in the construction of realtime systems. Without it, a single time-intensive task can degrade an entire system's performance. Time slicing can serve other important purposes as well. It can be used to distribute computer processing time more evenly among several tasks performing similar time-consuming functions. This makes the operation of the entire group of tasks appear more even. If a task becomes I/O-bound or takes too long to execute, QNX suspends its execution and switches to the next task of like priority. All tasks of a given priority are completed before tasks scheduled at the next lower priority are run.

The QNX architecture supports as many as 256 different tasks, yet the standard QNX system allows the user to create a maximum of only 40 tasks at once. Another QNX version (for the AT and compatibles) permits 64 tasks.

The status of any task running under QNX can be investigated at any time using the TASK\_INFO function. This function returns the full status, including such items as task priority, blocked state, links to other tasks, message status, and memory requirements. TASK\_INFO works on virtual tasks through the network.

Tasks under QNX also have an associated state. A task can be *ready*, which means it is ready to run based on priority and time-slicing constraints. A task also can be *dead*, which implies that the task has completed its execution. In addition, a task can be *held* by other tasks, or it may be *blocked* for some reason. Blocking usually takes

place with a task that is trying to send, receive, or reply to a message. If a task attempts to send a message to another task that is not ready, the sending task will block. This blocking can occur locally or over the network.

Finally, tasks can exert control over each other using two specialized functions: HOLD gives one task complete control over another task (and all of its child tasks) or can be used by a task to stop itself or another task; UNHOLD removes previous hold actions on a task. Both functions work on virtual tasks.

## INTERTASK COMMUNICATION

QNX provides three methods of inter-task communications: *ports* (not to be confused with serial or RS-232 ports), *message passing*, and *exceptions*. Each method offers its own speed and information-carrying abilities. Quantum also has recently implemented *mailboxes*, which allow a task to check for and read stored messages without blocking. Mailboxes will become an integral part of all future QNX releases. Collectively, these tools provide a complete array of realtime communications tools.

**32 MB Boundary Gone!**

CIRCLE NO. 169 ON READER SERVICE CARD

**SQL Compatible Query System adaptable to any operating environment.**

**CQL Query System.** A subset of the Structured English Query Language (SEQUEL, or SQL) developed by IBM. Linked files, stored views, and nested queries result in a complete query capability. File system interaction isolated in an interface module. Extensive documentation guides user development of interfaces to other record oriented file handlers.

#### **Portable Application Support System**

**Portable Windowing System.** Hardware independent windowing system with borders, attributes, horizontal and vertical scrolling. User can construct interface file for any hardware. Interfaces provided for PC/XT/AT (screen memory interface and BIOS only interface), MS-DOS generic (using ANSI.SYS), Xenix (both with and without using the curses interface), and C-library (no attributes).

**Screen I/O, Report, and Form Generation Systems.** Field level interface between application programs, the Query System, and the file system. Complete input/output formatting and control, automatic scrolling on screens and automatic pagination on forms, process intervention points. Seven field types: 8-bit unsigned binary, 16 bit signed binary, 16 bit unsigned binary, 32 bit signed binary, monetary (based on 32 bit binary), string, and date.

**\$395.00**

**C Interpreter.** Run the interpreter on any hardware and on any operating system. Develops true intermediate code, allowing full C features in an interpreter. User configurable interface to compiler library allows linkage with compiled routines.

## **QNX**

**Ports.** This method provides the simplest communications between tasks. A port is simply a binary number from 0 to 255 that is reserved to describe a user-defined operation. Ports usually are associated with external hardware events and are used to synchronize a task with that hardware or another task. Ports are employed as semaphores to control access to hardware or a specific resource. When two tasks communicate through a port, no actual message is passed between them. Only an event, or the lack of one, is signaled. Although QNX has the capacity for as many as 255 ports, it is typically configured with only 28 or 40. Information on how the QNX package is configured is not included in the documentation.

To use this method, a task first invokes the ATTACH function to lock onto a specific port (by number). Once attached, that task owns the port until it executes a DETACH function. A second task attempting to attach to the same port will fail. That task can use DETACH to determine the task ID of the task that owns the port. The second task then can wait until the task that owns the port either detaches or dies (which automatically detaches the port). This method can be used to synchronize any number of tasks. It provides a simple semaphore to control the access of multiple tasks to a common resource.

Several other functions provide more advanced port-related utilities. A task can wait for a signal to be sent to a specific port using AWAIT. The task will remain blocked after it has performed the AWAIT until a signal is sent to that port via either a SIGNAL or a CSIGNAL function. READ\_PORT allows a task to detect whether any signals are pending on a port, without suspending the task's operation if no message is there.

Ports are the primary method used by interrupt handlers to communicate with other tasks under QNX. Port-related functions execute quickly because they do not pass messages. Ports are also a convenient way to synchronize independent tasks. A listing routine, for example, might attach to a specific port. This would signify that the printer is currently busy. Any other task that wishes to use the printer would first attach to the specific port to see if the printer were available. If the ATTACH is not successful, the task would have to wait for the task that is attached to the port to DETACH. When the listing task detaches, the printer is free, and other tasks then can use it by attaching themselves to the specific port. This effectively builds up a queue of tasks, all of

which want access to the printer. These tasks execute one at a time in the order they were scheduled.

**Messages.** A message is a sequence of bytes (between 0 and 65,535 in length) that is passed from one task to another. No format is assumed or imposed on the content of the message by the operating system; each task or application must impose its own structure on the contents. The message-passing protocol is determined by the application task. In a typical protocol, one task will block, awaiting a message. When a second task sends a message to the blocked task, the blocked task will activate, process the message, and send a reply.

Passing messages is an inherently slow method for a realtime executive, and the time it requires depends on the length of the message passed. This restriction may cause problems for high-speed operations.

QNX offers special function calls that allow tasks operating on different network machines to communicate with each other. The functions VC\_CREATE and VC\_RELEASE let tasks control the operation of a *virtual circuit*, which connects two virtual tasks with a private data channel. No task ever has to send a message explicitly across the network—it simply opens a virtual circuit. This is done by first executing VC\_CREATE, which returns a virtual task ID. From that point on, operation of the virtual circuit is transparent to both tasks. When the virtual circuit is no longer needed, the sending task must release it back to the operating system using the function VC\_RELEASE.

Messages may be passed between tasks using any of several different methods. One of the simpler techniques uses the three functions SEND, RECEIVE, and REPLY. These functions allow a task to send a message to another task and wait for a reply. Messages under QNX are never lost, as can happen with some other realtime executives. If a message is sent to a task that is not ready for it, the message is saved until the specified task is ready to accept it. The sending task is blocked until it receives a reply to its message. Note that this method of message passing has repercussions for both sending and receiving tasks.

The operation proceeds as follows: SEND passes a message to a specified task and allocates room for a reply from the receiving task; the sending task then blocks until the second task receives the message and sends a reply. The function RECEIVE performs the other half of this operation. A task that exe-

PC Magazine  
Product of the Year

# Macro Assembler

The quickest. Bar none.

Our Macro Assembler has long been the most complete package on the market. Now it's also the fastest. Three times faster than before. And faster than anyone else. Period.

Of course, it's still the most powerful assembler on the market. It supports the standard 8086/8087 opcodes. And the new 186/286/287 instruction set. So you can make the most of the new machines.

Debugging is quicker, too. Thanks to our interactive symbolic debugger, SYMDEB. Now you can refer to variables and source code instead of getting lost in hex dumps. And this debugger also works with Microsoft languages like C, FORTRAN and Pascal. So now you can set breakpoints and trace execution — using source code for reference.

Cut your development time dramatically. Microsoft Macro Assembler's Symbolic Debug utility lets you debug your Macro Assembler programs, or debug your Microsoft C, FORTRAN or Pascal programs using your original source code or the resulting disassembly. For example, you can set breakpoints on line numbers and observe the contents of variables or expressions.

SYMDEB is just part of our complete set of utilities. Tools that make programming as fast as it should be. There are the linker and library managers you'd expect. Plus a new version of MAKE, our maintenance utility, with improvements like macro expansions and inference rules.

We've also revised the manuals. Our new Macro Assembler has a lot to offer, so we added more examples. Now our manuals are

not only thorough, they're clearer than ever before.

For quick development and assembly, the choice is obvious. Microsoft. There's nobody faster.

## Microsoft® Macro Assembler Version 4.0 for MS-DOS®

### Macro Assembler

- Fastest macro assembler for MS-DOS computers.
- Supports the 8086/8087/8088 and the 186/286/287.
- Define macros.
- Conditional assembly.
- Optional case sensitivity for symbols.
- 100% upward compatibility from earlier versions of both the Microsoft and IBM® Macro Assemblers.

### Interactive Symbolic Debug Utility

- Source level debugger for programs written in Microsoft Macro Assembler, C Compiler, FORTRAN, and Pascal.
- Screen swapping helps debug highly visual applications.
- Set breakpoints on line numbers and symbols.
- Single step to follow program execution.
- Disassemble object code.
- Display and modify values.
- Full I/O redirection.

### Program Maintenance Utility

- Rebuilds your applications after your source files have changed.
- Similar to UNIX™ MAKE utility.
- Supports macro definitions and inference rules.

### Library Manager

- Create, organize and maintain your object module libraries created with Microsoft languages.
- Set page size from 16 to 32678, to create compact and granular libraries.

### Object Code Linker

- Simple overlaying linker combines relocatable object modules created using Microsoft languages into a single program.
- Load Map generation.
- Specify from 1 to 1024 segments.

### Cross-Reference Utility

- Creates a cross-reference listing of the definitions and locations of all symbols used in an assembly language program, which makes debugging programs easier.

### Microsoft EXE File Compression Utility

- Packs EXE files for smaller size on disk and faster loading at execution time.

### Microsoft EXE File Header Utility

- Display and modify EXE file header, allowing you to tune the stack size and initial memory allocation.

# "How to protect your software by letting people copy it"

By Dick Erett, President of Software Security

Inventor and entrepreneur, Dick Erett, explains his company's view on the

protection of intellectual property.

**"A** crucial point that even sophisticated software development companies and the trade press seem to be missing or ignoring is this:

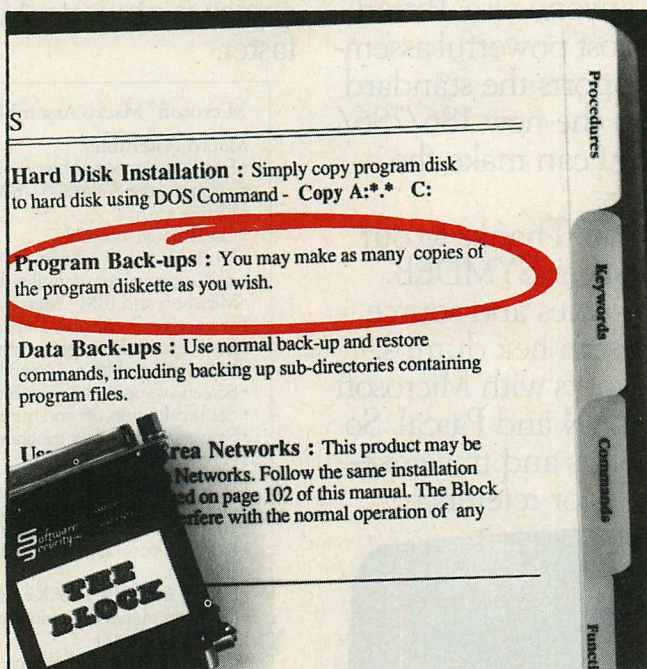

*Software protection must be understood to be a distinctively different concept from that commonly referred to as copy protection.*

Fundamentally, software protection involves devising a method that prevents unauthorized use of a program, without restricting a legitimate user from making any number of additional copies or preventing program operation via hard disk or LANs.

Logic dictates that magnetic media can no more protect itself from misuse than a padlock can lock itself.

Software protection must reside outside the actual storage media. The technique can then be made as tamper proof as deemed necessary. If one is clever enough, patent law can be brought to bear on the method.

Software protection is at a crossroads and the choices are clear. You can give product away to a segment

*Soon all software installation procedures will be as straightforward as this. The only difference will be whether you include the option to steal your product or not.*

of the market, or take a stand against the theft of your intellectual property.

*"...giving your software away is fine..."*

We strongly believe that giving your software away is fine, if you make the decision to do so. However, if the public's sense of ethics is determining company policy, then you are no longer in control.

We have patented a device that protects your software while allowing unlimited archival copies and uninhibited use of hard disks and LANs. The name of this product is The BLOCK™.

The BLOCK is the only patented method we know of to protect your investment. It answers all the complaints of reasonable people concerning software protection.

In reality, the only people who could object are those who would like the option of stealing your company's product.

*"...eliminating the rationale for copy-busting..."*

Since The BLOCK allows a user to make unlimited archival copies the rationale for copy-busting programs is eliminated.

The BLOCK is fully protected by federal patent law rather than the less effective copyright statutes. The law clearly prohibits the production of work-alike devices to replace The BLOCK.

The BLOCK attaches to any communications port of virtually any microcomputer. It comes with a unique customer product number programmed into the circuit.

The BLOCK is transparent to any device attached to the port. Once it is in place users are essentially unaware of its presence. The BLOCK may be daisy-chained to provide security for more than one software package.

Each software developer devises their own procedure for accessing The BLOCK to confirm a legitimate user. If it is not present, then the program can take appropriate action.

*"...possibilities... limited only by your imagination..."*

The elegance of The BLOCK lies in its simplicity. Once you understand the principle of The BLOCK, hundreds of possibilities will manifest themselves, limited only by your imagination.

Your efforts, investments and intellectual property belong to you, and you have an obligation to protect them. Let us help you safeguard what's rightfully yours. Call today for our brochure, or a demo unit."

**Software Security inc.**

870 High Ridge Road Stamford, Connecticut 06905  
203 329 8870

**TABLE 2: QNX System Exceptions**

EXCEPTION	DEFINITION
EXC_HANGUP	Loss of modem carrier
EXC_BREAK	Keyboard break
EXC_QUIT	Program debugging
EXC_COM	Communications error
EXC_SHARE	Missing shared library
EXC_FLOAT	Floating-point error
EXC_KILL	Kill task
EXC_MEM_V	Memory violation
EXC_ALARM	Set by system timer task
EXC_TERM	Task termination
EXC_DIV_Z	Divide by zero

QNX supports 32 exceptions that are used to notify a program of specific circumstances or events. Currently, 11 system exceptions are defined.

cutes a RECEIVE will block until a message has been received. (If a message has already been sent to this task before it performed the RECEIVE, the task does not block, but instead immediately processes the message that was sent to it.) Once the receiving task has processed the message, REPLY is used to send a reply back to the sender. It can be used only after a RECEIVE command and causes a specific response to be sent to the appropriate task. No task blocking occurs on the receiving end.

Sometimes a task needs to be able to read in a message without blocking if no message is waiting for it. (The task does not want to remain blocked, waiting for a message that might never arrive.) In this case, CRECEIVE, a non-blocking form of RECEIVE, is used. When a task executes a CRECEIVE, it returns either with a message, if one was pending, or with an error condition, indicating that no message was found.

Another useful message-handling function, RELAY, allows a task to relay, or pass on, a message to another task. This function does not block either task. RELAY allows a task to send the same message to more than one other task. **Exceptions.** This method passes limited messages between tasks. Exceptions are used for specific circumstances or special events associated with program tasks. An exception can be generated as the result of a hardware or software problem and is task-specific with regard to the tasks it addresses. For example, an exception generated for "loss of modem carrier" has no effect on tasks not concerned with the modem.

QNX supports two types of exceptions: system or user-defined. Within each type, 16 different exceptions are possible. The 11 currently defined system exceptions are listed in table 2.

Two functions are involved in the generation and handling of exceptions: SET\_EXCEPTION and EXC\_HANDLER. If an exception is generated for a specific task, and no exception handler has previously been established by that task, then the task in question is destroyed. (This task destruction includes all child tasks.) SET\_EXCEPTION lets a task generate a specific exception, either system or user-defined, for a task. The function EXC\_HANDLER lets the task define a handler for a specific exception. Once an exception handler is defined, exceptions signal the occurrence of an unusual event. The software exception handler then responds to the event.

**Mailboxes.** A realtime system often requires more communications capability than is available with the simple message-passing functions just described. For example, a task might have to wait for a message or for a fixed time to expire. Further, it might have to wait for a message from one or more possible sources. Functions such as these typically are accomplished in realtime systems via mailboxes. The QNX mailboxes are supplied in source code form and are arranged as administrator tasks. The user thus can extend the mailbox concept or alter its operation if desired.

The mailbox administrator supplied by Quantum contains seven major functions. (In addition, provisions have been made for extending the mailbox concept to include waiting on multiple mailboxes, optional time-outs associated with a mailbox, and the use of signals or ports to trigger mailboxes.)

MBOX\_OPEN and MBOX\_CLOSE enable a task to create and use a mailbox. When a task attempts to open a specific mailbox, the administrator first checks to see if such a mailbox already exists. If it does, MBOX\_OPEN returns

# DAN BRICKLIN'S DEMO PROGRAM

Read what they're saying about this new concept in prototyping and demo-making:

**"A winner right out of the starting gate. After you use DEMO once, you'll wonder how you got along without it."**

— PC Magazine, 4/29/86

**"Everybody who writes software, either commercially or for in-house applications, should immediately order a copy. Period. No exceptions."**

— Soft\*letter, 4/20/86

**"Its low price, superb performance, and range of applications practically guarantee that it will be widely used. Four Floppy Rating (8.0)"**

— InfoWorld, 3/31/86

**"Apparently has a hit on its hands with... a development tool for personal computer software that has won rave reviews from early users."**

— Computerworld, 4/7/86

**"A gem."**

— PC Week, 3/18/86

**Product of the Month**

— PC Tech Journal, 3/86

## ORDER NOW!

Thousands of developers are designing better products faster and producing more effective demonstrations using Dan Bricklin's Demo Program. You can, too. Act now!

**ONLY \$74.95**

**617-332-2240**

Massachusetts residents add \$3.75. Outside of the U.S.A. add \$15.00.

status information about the mailbox. If the mailbox does not exist, the administrator creates a new one. The function `MBOX_CLOSE` terminates a specific mailbox; it can be altered to ensure that the mailbox would be terminated immediately or following the reception of all currently pending messages.

`MBOX_WAIT` lets a program block pending mail at a specific box. Optional extensions to this function would let a task wait, pending receipt of a message at any of several different mailboxes or for a specific period.

Three interrelated functions are used to control the sending and receiving of messages at mailboxes. The function `MBOX_POST` sends a message to a specific mailbox. `MBOX_QUERY` lets a task check for mail without blocking. `MBOX_READ` allows the task to read any mail that is found. All three functions require the mailbox in use to have been opened previously.

Finally, `MBOX_INFO` is a debugging tool that provides a "snapshot" of the mailbox system at any time. It can report the status of all mailboxes, tasks,

and messages running under the mailbox administrator. The documentation offers only a skeleton outline for this function. Because it is primarily a debugging tool, the exact nature of its operation is determined by the specific application being debugged.

### MANIPULATING TIME

A good realtime executive offers various means to control tasks based on time or to time assorted program functions. QNX has two types of time-control function. The first set—which consists of `GET_DATE`, `GET_TICKS`, `SET_DATE`, and `SET_SLICE`—controls the operating system's use of time. The second set—`ABS_SLEEP`, `SET_TIMER`, and `SLEEP`—is used to control tasks or program operation based on time.

`GET_DATE` and `SET_DATE` get or set the current system time and date. Each is accurate only to the nearest second. Finer accuracy is provided by `GET_TICKS`, which returns a value representing the current number of system clock ticks. This number is not directly related to any particular time. The standard QNX system uses a default clock rate of 20 ticks per second, allowing `GET_TICKS` to measure time to within 50 ms. The default tick of 50 ms often is not fast enough for realtime functions that require time control. Therefore, a special function called `CHANGE_TICK` lets a task change the number of ticks per second. Quantum says that the tick rate may be set as high as 250 ticks per second for a PC or 1,000 ticks per second for an AT. Such high rates significantly increase system overhead.

`SET_SLICE` defines the number of clock ticks represented in each time slice. This function is used to determine the amount of time every program task is allotted as it is time-sliced by the operating system. `CHANGE_TICK` interacts with the function `SET_SLICE` because time slicing is defined in clock ticks, not in fractions of a second.

QNX supports a variety of timer actions. All timing functions use a single call to the `SET_TIMER` routine. This call must specify either a relative amount of time measured in clock ticks or a fixed time and date. (Note again that specifying time in clock ticks provides for a finer control over realtime tasks.) When a time has expired, several control options are available. For example, the timer call can be used to block the current task until the time has expired. A timer call also can be used to force a task to become ready that previously had been blocked because of a `SEND`, `RECEIVE`, or `REPLY`. The `SET_TIMER`

# 9 TRACK TAPE

Our "TAPE CONNECTION" system is used by hundreds of companies for mailing lists, report filing, check processing, sales analysis, off-line printing, and exchanging large data base files with a mainframe. Our system features:

- Attach to most IBM PC compatibles
- Cobol, Fortran, BASIC, and C support
- 800 NRZI, 1600 PE, and 6250 GCR
- Transfer rate is 1-4 MByte/Minute
- Block lengths up to 65K
- ANSI, IBM, DEC, and DG supported
- Support for most record types
- Multivolume and labeled tapes
- Select specific records to transfer
- Record reformatting and translation
- Hard disk backup utility
- Support for many tape drive models

The price for controller card, cable, and transfer software is **only \$795**. The optional tape data reformatting utility is **\$195**. Several model tape drives are available for **\$2700 to \$9200** depending on features.

Since 1982, we have installed thousands of diskette and tape conversion systems at customer locations around the world. Call us today for help in connecting a 9-track tape system to your IBM PC.

1120 W. Kaibab • Flagstaff, AZ 86001 • Telephone 602-779-3341

You can eat 37% more carrots.  
Or you can get our new  
VEGA Deluxe™ EGA card.

Despite its  
improvements  
over CGA, today's  
garden-variety  
Enhanced Graphics  
Adapter can still be a strain on  
the eyeballs.

May we introduce you to a sight  
for sore eyes: the new VEGA Deluxe  
EGA card. A short-card video adapter  
that goes beyond standard EGA to bring  
you as much as 37% higher screen resolution.

In pure pixels, that means 640 x 480. *And 752 x 410.*

With as many as 16 on-screen colors from a palette of 64.

That, in turn, means sharper lines. More brilliant colors. And less strain on your  
eyes. (Of course, you can't see more than your monitor will display. So for more than  
640 x 350, the VEGA Deluxe requires a Multisync® or equivalent.)

The VEGA Deluxe is compatible with every other video standard: EGA, CGA,  
Hercules and MDA. And it automatically selects which standard  
is right for your software's needs when used with a compatible  
monitor.

Not only that, the VEGA Deluxe includes high-resolution  
drivers for Microsoft Windows and Lotus 1-2-3 with 120  
columns and 43 lines. EASYCAD, EGA Paint, GEM, Dr. Halo,  
In•A•Vision, Windows Draw, Windows Graph, and many  
more now support VEGA Deluxe high resolution.

CIRCLE NO. 204 ON READER SERVICE CARD

routine also can be used to signal either a port or an exception or to cancel any previously set timer function.

The ABS\_SLEEP and SLEEP commands give a task time-based control over its own execution. ABS\_SLEEP lets a task suspend operation (that is, actually to block itself) until a fixed time and date transpires. SLEEP lets a task suspend itself for a fixed number of seconds. Both commands are especially useful in the creation of tasks that must perform functions at repetitive or other fixed-time intervals.

When using the QNX timing functions in a networked system, it is important to remember that different computer systems are likely to be running at different speeds. In particular, in order to obtain maximum timing resolution out of QNX, the user must specify times in clock ticks. It is important, therefore, to choose a clock rate and stay with it. Otherwise, close attention will need to be paid to which machine is running a specific application, and timing-related functions then will have to be adjusted accordingly.

## INTERRUPT CONTROL

QNX permits additional interrupt handlers to be added to its basic structure. Interrupt support is already provided for the standard serial RS-232 ports, a realtime clock, diskette and hard-disk drives, and a network. Additional interrupts may be added in a two-part process. First, an interrupt handler must be written in assembly language. This handler is not a task and may not issue calls to the QNX system kernel (that is, it cannot use SEND, RECEIVE, REPLY, or any I/O calls from the system library.) Interrupt handlers usually are created to gather information from a device and signal an administrator that an interrupt has occurred. Writing interrupt handlers for the AT's protected mode requires programming techniques that are slightly different than those used for real mode.

Next, an interrupt administrator must be written. This is constructed as a task that runs under QNX and communicates with the interrupt routine through ports. A specialized system-call interrupt 71H is provided that allows interrupts to signal tasks through ports in a reentrant fashion. This administrator is responsible for managing all user-defined interrupt resources. It also enables and initializes interrupts. Interrupt masks are set by SET\_INT\_MASK. The QNX C compiler manual provides detailed information on writing an interrupt administrator.

## APPLYING QNX

QNX is not a dominant realtime control system for the IBM PC. Although it is a popular operating system, 50 percent of its users do not take advantage of its realtime control features. According to Quantum, only about 20 percent of the installed user base exploits its realtime process control. Another 30 percent of the company's customer base is using QNX to perform point-of-sale and data communications applications that, in the process, make use of realtime aspects of the product. The remainder of QNX users are employing it as a multitasking, multiuser operating system.

QNX is not well known in the realtime operating system arena. Most of the dominant realtime executives for the PC can trace their roots to other computer systems. Hunter & Ready's VRTX/86 and Intel's iRMX86, for example, both existed long before the PC was introduced. Each of these executives had a large base of users when the system was ported to the PC. Newer executives either have had to take users away from the market base of others or

# Lattice® Works

## SCREEN DESIGN AID (SDA) IS NOW AVAILABLE FOR RPG II PROGRAMMERS

The Lattice Screen Design Aid (SDA) utility helps Lattice RPG II programmers create and modify display screen formats during the development and testing of application programs. Instead of coding S and D specifications for the SFGR, SDA allows you to build displays directly on your PC. When the displays on the screen are as you want them, SDA creates the SFGR source file, the screen format file for the RPG program and the skeleton RPG program for the WORKSTN file; and it can optionally print out a source listing. This product now joins Lattice Sort/Merge (LSM™) and Source Entry Utility (SEU) in supporting the Lattice RPG II compiler. \$350.00

## LATTICE ANNOUNCES NEW SCIENTIFIC SUBROUTINE PACKAGE

SSP/PC is a library of mathematical subroutines essential to scientific, engineering and statistical computations. Comprised of more than 145 subroutines callable from FORTRAN, Pascal, BASIC and C, SSP/PC is as extensive as similar packages generally used on mainframe computers. The routines are very fast and extremely accurate

and provide extensive error diagnostics. The Error Messages save the user from inadvertent mistakes. Using SSP/PC, scientists and engineers can save time by freeing themselves from tedious and difficult programming.

SSP/PC functions include: 34 Elementary Fcns, 18 Probability and Statistical Fcns, 15 Random Number Generators, Ei(x), E<sub>n</sub>(x), li(x), Si(x), Ci(x), Γ(x), ψ(x), B(x,ω), I<sub>a</sub>(a,b), erf x, S(x), C(x), J<sub>v</sub>(z), Y<sub>v</sub>(x), I<sub>v</sub>(z), K<sub>v</sub>(x), Ai(x), Bi(x), Ai'(x), Bi'(x), ber x, bei x, ker<sub>1</sub> x, kei' x, K(x), E(x), F(ρ|a), E(ρ|a), Π(ρ|a,b), Λ(a,b,ρ), ℘(z), ℘'(z), P<sub>n</sub>(x), H<sub>n</sub>(x), L<sub>n</sub><sup>(α)</sup>(x), J<sub>n</sub><sup>(α,β)</sup>(x), G<sub>n</sub>(p,q,x), C<sub>n</sub><sup>(α)</sup>(x) and many more. \$350.00

## LATTICE NOW OFFERS CODE SIFTER

Code Sifter is a software development tool that enables programmers to write faster executing software. It produces CPU usage statistics that indicate which code sections are the heavy CPU users. Using this information you can concentrate your optimization efforts on the areas that are really the bottlenecks and ignore the routines that are light CPU users.

A major advantage of Code Sifter over other products of this type is that it does not require that the user have knowledge of the machine architecture or assembly language. Link map listings are optional. In most cases Code Sifter can set up the ranges and repeatedly subdivide them automatically, freeing the programmer from a lot of drudgery. \$119.95

# 15 SUCCESS MANUALS that could solve your money problems once and for all!

## FASTEST, EASIEST ... PROVEN PROFITABLE BUSINESSES YOU CAN QUICKLY START AND OPERATE FROM HOME WITH LOW OR NO CAPITAL ... PART TIME OR FULL TIME ...

No experience required ... Nothing complicated to study ... Strictly legal and honest ... Each beginners Success Manual is Guaranteed to teach you everything you need to know to succeed fast! The perfect answer for ambitious men and women ...

### 1. FIFTY QUICK, EASY AND MOST UNUSUAL WAYS TO POCKET "GIANT DOLLARS!"

Here's your chance to discover how so many folks miss out on numerous opportunities to pull in some big, fast cash. A most unique money-opportunity book which quickly shows you how just ordinary men and women from all walks of life are building spare time and full time fortunes; plus home businesses, money secrets, wealth-building methods, out-of-the-ordinary plans and odd blue prints to success, plus more. (only \$6.95)

FIFTY QUICK, EASY AND MOST UNUSUAL WAYS TO POCKET "GIANT DOLLARS!"

### 2. HOW TO STACK UP HUGE MAIL ORDER PROFITS — HAND OVER FIST WITHOUT BREAKING YOUR BACK (OR RISKING AN ARM OR A LEG)

Shows you how to immediately set up — and get your operation off to a smooth flying start. Quickly teaches you short cut mail order fundamentals from A to Z. Crammed with insider "tricks of the trade" and revealing "money getting gimmicks." Imagine yourself receiving envelopes containing hundreds of dollars or more a day every day — that's the potential of mail order. (only \$6.95)

HOW TO STACK UP HUGE MAIL ORDER PROFITS — HAND OVER FIST WITHOUT BREAKING YOUR BACK (OR RISKING AN ARM OR A LEG)

### 3. HOW TO SEW YOUR WAY TO PRETTY PROFITS FAST!

It's a fact that millions of women (and men, too) own their own sewing machines ... and truly enjoy sewing. This peculiarly profitable book clearly demonstrates to them how to, virtually, turn their sewing machines into money making machines ... and take fast and full advantage of today's most promising market conditions. Especially — considering the present sky-high prices. (only \$6.95)

HOW TO SEW YOUR WAY TO PRETTY PROFITS FAST!

### 4. HOW TO TURN YOUR TELEPHONE INTO A MONEY MAKING MACHINE:

Right now your phone is only costing you money — but if you knew how to make it work for you, it could be making you money. Many people have heard about men and women making handsome incomes, via their telephone. But only a few people know exactly how it's done. Complete easy-to-follow instructions. (only \$6.95)

HOW TO TURN YOUR TELEPHONE INTO A MONEY MAKING MACHINE

### 5. HOW TO EARN A FISTFUL OF MONEY WITH NEWSPAPER CLIPPINGS:

Imagine, earning good money by clipping articles from newspapers? This unusual book instructs you in straight-to-the-point, how-to-information. Fast starting operation by mail on a tiny shoestring capital. Unusual way to earn \$50, \$100, \$300 or more, weekly. Ideal for ambitious Homeworkeers, spare-time or full. (only \$6.95)

HOW TO EARN A FISTFUL OF MONEY WITH NEWSPAPER CLIPPINGS

### 6. HOW REAL ESTATE CAN MAKE YOU A FORTUNE ... USING OTHER "FOLKS MONEY:"

Real estate has produced more millionaires than any other field. The plans inside this amazing fast, fortune-building book tells why and how, in easy-ABC fashion; learn how to let other folks money work for you; speculate in raw land and get back \$5 for every \$1 you put in; rake in huge profits on Uncle Sam's losses; set up a nice income for yourself and your family with little or no investment. (only \$6.95)

HOW REAL ESTATE CAN MAKE YOU A FORTUNE ... USING OTHER "FOLKS MONEY:"

### 7. WORK-AT-HOME SUCCESS GUIDE (For Men and Women)

Time and time again — successful spare time and full time businesses are made with out-of-the-ordinary methods; out beat money making ideas, prosperous home enterprises. Shows how plain every day folks from all walks of life can stack up good money. Here's your opportunity to go after incredible wealth. (only \$6.95)

THE AMAZING HOME WORKER'S WORK-AT-HOME SUCCESS GUIDE (For Men and Women)

### 8. AMAZING MONEY MAKING TREASURY OF 1 & 2 INGREDIENT FORMULAS THAT COULD PUT YOU ON EASY STREET

This startling opportunity book places the little "beginner" operator with tiny capital in a most profitable position to manufacture sellable products. All preparations require no more than two chemicals, many just one. All represent a popular best-seller kind of product with both genuine merit and wide sales appeal. No expensive equipment or facilities required. You can almost always pack everything from your kitchen. (only \$6.95)

AMAZING MONEY MAKING TREASURY OF 1 & 2 INGREDIENT FORMULAS THAT COULD PUT YOU ON EASY STREET

### 9. WORLD'S EASIEST MOST PROFITABLE MAIL ORDER BUSINESS ...

A relatively uncrowded business that any man or woman can enter regardless of age. Book shows you how to start small, with "piggy bank" capital and grow prosperous year after year. Reveals the surest, most profitable and safest items to sell by mail. Crammed with all the precious, easy-to-understand details. (only \$6.95)

WORLD'S EASIEST MOST PROFITABLE MAIL ORDER BUSINESS ...

### 10. TWELVE SIMPLE LITTLE-KNOWN WAYS TO MAKE BIG MONEY FAST!

An amazing book that clearly reveals a dozen ways men and women could pocket some real fast cash profits — if they only knew the right wealth building moves to make. This book quickly teaches you all the necessary moves, shows you exactly how and what to do to help assure your success. (only \$6.95)

TWELVE SIMPLE LITTLE-KNOWN WAYS TO MAKE BIG MONEY FAST!

### 11. HOW TO SIT BACK AND RAKE IN A BUNDLE SELLING BOOKS BY MAIL:

Practically all mail order experts agree that absolutely nothing sells better by mail than books. ... and there's nothing that sells easier than books. Better yet — you stand to make bigger and faster net profits from selling books by mail than you could realize on any other items. You will be shown everything from A to Z. (only \$6.95)

HOW TO SIT BACK AND RAKE IN A BUNDLE SELLING BOOKS BY MAIL

### 12. HOW TO WIN BIG CASH AND VALUABLE PRIZES CONTESTS:

This unique book quickly shows you all the important inside tricks. Opportunity to win national and local contests again and again. Cash, cars, homes, appliances, furs and vacations ... No other publication on the market exactly like it. (only \$6.95)

HOW TO WIN BIG CASH AND VALUABLE PRIZES CONTESTS

### 13. BIG FAST FULL TIME AND PART TIME PROFITS FOR WOMEN:

This book is a remarkable treasury of unique but common sense, easy to operate Little "big" money making businesses for many millions of today's serious and enterprising women interested in fabulous earnings, independence and security. Little or no investment and fast starting full- and part-time income increasing activities. (only \$6.95)

BIG FAST FULL TIME AND PART TIME PROFITS FOR WOMEN

### 14. EASIEST AND FASTEST WAY TO START A SUCCESSFUL MAIL ORDER BUSINESS ON A SHOESTRING:

Simple, and most effective, step-by-step mail order start-up and operating instructions written especially for beginners. Crammed with vital facts ... Covers every aspect of this exciting big money field. (only \$6.95)

EASIEST AND FASTEST WAY TO START A SUCCESSFUL MAIL ORDER BUSINESS ON A SHOESTRING

### 15. HOW TO SEE THE WORLD ... TRAVEL AND GET PAID WELL FOR IT:

Everyone enjoys traveling. But most people cannot afford to travel to those far away places they dreamed of visiting. Here's your chance to take in the wonderful sights throughout the world — and actually get paid for doing it. Yes, it's truly possible that this little known strictly legal method could provide you with the information for doing it. (only \$6.95)

HOW TO SEE THE WORLD ... TRAVEL AND GET PAID WELL FOR IT

### Fifteen Ways For You To Have Bulging Bank Accounts, Beautiful Homes, Expensive Clothes, Jewelry, Exotic Vacations ... The Very Best Colleges For Your Kids ... Plus, Keep A Steady Income Flowing In!

Everyone of the 15 Manuals' home-based businesses, can be successfully operated, by a single person, retirees, unemployed people — most ideal for husband/wife teams — and can be, almost, instantly turned into an enterprising family operated business, kids can help too. With everyone pitching in ... your business could suddenly take off, and profits could increase fast!

### More Businesses You Operate ... More Money You Make ... Guarantees You Riches Beyond Your Wildest Dreams!

So, be sure to keep in mind that: Even though, it's true — some good money could be made with just a single one of these start-up success manuals working for you ... but, much better than that, you could give yourself a greater opportunity to make your profits to multiply much faster, by simply putting together a super powerful profitable combination of five, ten, or more of these fifteen — fastest, easiest ... proven profitable businesses out of over a thousand in our files. Imagine having them all operating, and bringing in big hefty profits for you, at the same time! But you must send your order in right away. Supplies are extremely limited at these special introductory low prices!

HOW TO RETIRE YOUNG AND LIVE LUXURIOUSLY ON VERY LITTLE MONEY.

### FINALLY A REAL OPPORTUNITY TO ENJOY A RICHER ... BETTER LIFE

Our organization — Successful Business Publishers, offers what is perhaps the largest collection of Unique "Home-business" Beginner's Success Manuals in the world! Out of over a thousand of businesses in our organization's files — our home business specialists, have painstakingly selected The 15 Fastest, Easiest ... Most highly Profitable part-time and fulltime Businesses you and other beginners can quickly start and easily operate from home — with very low or, virtually, no investment.

How many of these Proven, Highly Profitable Enterprises, can you combine together and successfully operate — and Benefit From At The Same Time? Possibly, all fifteen if you're that ambitious ... The big Shrewd Corporations, call this almost secret method "diversification" which is, merely, a high sounding big word, which simply boils down to — having a lot of different businesses, operating ... and pouring fast-fat profits into your pockets, at the same time.

Let's face it — Plain common sense says that — the more of these 15 Proven Profitable Businesses, you choose to operate at the same time ... the bigger, and faster your profits could be! Of course, our organization will profit a few more dollars if you choose to put five, ten, or all fifteen of our proven profitable, start-up success manuals, to work for you.

But then — why should our making a modest few dollars of profit bother you — when it's you, who makes ... and keeps all the income — no matter how much — Your different home businesses bring in? The demand for our unique wealth-building, Beginners Start-Up Success Manuals has been so overwhelming ... and, understandably so too, since, there's absolutely nothing like them on the market!

### Our No-Risk Success Guarantee To You

You must be absolutely, positively, and totally convinced that the actual money making success probability of each manual is real — and easily quickly increase your income or you may return everything within 10 days for a prompt and no-hassle, full refund.

Remember, those who snooze will certainly lose. However, those who choose right now, to begin — can win, and right now, while there's still time, is the best time to begin. You'll be making a very wide and highly profitable move. ORDER NOW!

# HELP

USE WITH  
MS WINDOWS

is at hand

**HELP/Control™** - an on-line help subsystem for the IBM-PC.  
Increases the value of your software. Save development time and money.

**HELP/Runtime**. A few simple subroutine calls add context sensitive on-line help to your application. **HELP/Runtime** includes tested interfaces for Microsoft C, Lattice C, Turbo Pascal, IBM BASIC (Interpreter and Compiler), Microsoft FORTRAN, IBM COBOL and assembler. It is distributed with demonstration programs in each language.

**HELP/Popup**. Add a powerful help system to existing applications, even in dBase or 123, without reprogramming, even without a programmer. It may be memory resident, or, installed with an application, it terminates when the application exits, releasing its memory.

**HELP/Generation**. Use your favorite editor and our concise screen definition language to build your help files. Compile them into a help system usable by either **HELP/Runtime** or **HELP/Popup**. The package includes sources for sample help files illustrating such features as full-sized or windowed screens.

**HELP/Convenience**. The screens include highlighted captions. The user selects a caption with the cursor control keys and advances to a new screen, just as with 123.

**HELP/Documentation**. A detailed manual, both on-line and printed, for the documentation writer and programmer includes instructions which may be incorporated into the user manual.

**HELP/Environment**. PC-DOS 2.0 or greater is required. **HELP/Runtime** requires approximately 9K for code and buffers for full size help screens.

**HELP/Pricing**. The complete package (software, both manuals, and demo programs) costs \$125.00 and includes a royalty-free license to add **HELP/Runtime** to your applications and to make 25 copies of **HELP/Popup**. A demonstration diskette, including the on-line manual, costs \$15.00. A free update to Release 1.1 is available to registered owners. To order, or for more information (including dealer, multiple-copy and site-license pricing) call MDS at 207/772-5436. We accept MasterCard and VISA.

## QNX

have had to impress prospective buyers with the merits of a newer system.

Another reason for QNX's anonymity is its slant toward networked real-time control and emphasis on a multiuser approach. Most programmers doing realtime control work are more experienced in building single, dedicated, nondisk-based control systems. Realtime applications that require networking or multiuser input have become prominent only in recent years.

One significant problem with QNX is its documentation. Although it is lengthy (more than 1,000 pages), it is not oriented toward realtime control and does not even have a section or chapter devoted to realtime applications. In addition, many important details about the QNX realtime operation are not discussed; for example, no mention is made of the execution times needed to complete any of the realtime functions described in this article.

QNX's documentation, like that for many microcomputer products, is simply not at the same level as the software. In an effort to provide up-to-date information to users, Quantum does maintain an on-line system to all licensees that provides updates, material on known QNX difficulties, and so on.

QNX is also considerably slower than most of the other realtime executives previously reviewed in this *PC Tech Journal* series. The standard QNX clock tick on an AT running at 8 MHz is 50 ms (by contrast, several realtime executives are available for a 2-MHz 8080 that offer 1- or 2-ms clock ticks.) The QNX clock period is not fast enough to monitor transient events. Even though the period can be made shorter, the attendant increase in system overhead makes it difficult for QNX to compete with more tightly coded realtime executives. Using QNX to perform a large number of hardware control functions in realtime would be impractical.

Finally, QNX passes entire messages between tasks. Although this architecture allows QNX to take full advantage of its network configuration, it slows down the realtime operation of the system (because the length of the message directly impacts the time it takes to pass it). In addition, the majority of QNX realtime control functions cannot be used in interrupt handlers because they take too long to execute.

In what way, then, can QNX be used? In networking situations. The QNX system excels at networked realtime control that involves databases. It is currently being used successfully in numerous automated assembly line situ-

# AT performance at an XT price. Any way you look at it.

## **The TeleCAT-286™. \$2995. Complete.    The TeleCAT-286 EGA™. \$3595. Complete.**

If you're looking for a quality AT-compatible computer, TeleVideo® offers you not one, but two. With the TeleCAT-286. And now, the new TeleCAT-286 EGA.

Both of these compact computers give you a complete set of features. Like 512K RAM. A 1.2MB floppy. A 20MB hard disk. And a high-resolution monitor.

There's even a free 90-day nationwide on-site service agreement.

And if you want full EGA color, take a look at the new TeleCAT-286 EGA. With its

high-resolution 13-inch EGA color monitor, you get a full spectrum of brilliant displays. Its low-glare, high-contrast dark screen makes it easy on the eyes, too. You can even change this screen to green monochrome, with the flick of a switch.

What's more, the new TeleCAT-286 EGA comes with an EGA card that's fully IBM compatible, so you can run any full-color AT graphics software packages. And they'll never look better. Because this EGA card features 256KB of display RAM, and 640 X 350

graphics resolution, for bright colors and sharp text.

The result? A clear, crisp image that no CGA color monitor can ever live up to.

The TeleCAT-286, and the new TeleCAT-286 EGA. Find out more about them. Call 1-800-TELECAT (835-3228), Dept. 309, for the name of your nearest TeleVideo dealer.

And see for yourself why TeleCAT computers are definitely worth looking into.

 **TeleVideo®**  
Settle for more.

TeleVideo Systems, Inc., 1170 Morse Avenue, P.O. Box 3568, Sunnyvale, CA 94088-3568 • (408) 745-7760

CIRCLE NO. 182 ON READER SERVICE CARD

ations. The cornflakes control system described at the beginning of this article requires three PCs that share access to a common base of information about the cornflakes manufacturing process. QNX could manage this system with ease, but responsibilities such as these would be difficult to perform well with most dedicated realtime executives.

As long as an application does not require high speed and can take advantage of a networked architecture and database abilities, QNX is a good choice. It would work well, for example, as a realtime transaction database for point-of-sale terminals. QNX is designed to offer full, realtime control of disk systems and networks. This ability is not an add-on option, as is the case with most realtime executives; it is built into this system's basic structure.

However, QNX is not for the beginner, primarily because of the manner in which the documentation is presented. The manual is not oriented toward realtime control and would challenge even an experienced realtime programmer to find the material needed to explain QNX realtime aspects. In addition, a thorough familiarity with the C language and a passing acquaintance with UNIX is assumed by most of the material.

## OTHER PRICES PAID

The basic QNX development system includes the kernel, full-screen editor, utilities, C compiler, and manual. The price of this package depends upon the number of nodes it is intended to support. Software for a single computer system sells for \$650; software for 4- and 32-node systems, respectively, is \$1,300 and \$3,900. The package is also available without the C compiler in the aforementioned capacities for \$450, \$900, and \$2,700, respectively. A QNX networking board is required for each node in a system, at a cost of \$495 per node. A \$100 passive hub supports the connection of up to four nodes; an active hub, which sells for \$800, is required for larger configurations. The RG62U coaxial cable that is required for connecting nodes is priced separately.

If an application is being developed for resale that requires the QNX operating system, the QNX runtime system can be purchased from Quantum at a discount. Otherwise, a single computer package costs \$225, a 4-node system, \$450, and a 32-node system, \$1,350. The company also offers an OEM agreement in which a firm may manufacture the runtime system; the prices under this agreement start at \$90 for a single computer system, plus

\$22.50 for each additional node. Substantial discounts also are available on large-quantity purchases.

Several optional items for the QNX operating system include: a BASIC compiler for \$300 in single-node configuration, \$600 in 4-node, and \$1,800 in 32-node; and, in single-computer configurations: QNX Ctree, which provides indexed file management, \$295; QNX Chat Teleconferencing, \$95; QNX Doc Text Processor, \$250; QDOS II, a PC-DOS emulator and file system administrator, \$125; QNX Electronic Mail, \$150; and QNX AP, \$125.

Thus QNX emerges as a clearly credible alternative to some old-favorite realtime systems. Although the QNX operating system seems to address a particular segment of the realtime executive market, to that segment it speaks well and in a complete voice.

RAMDISKS and PRINT SPOOLERS  
INSTALL ABOVE 640KB

## THE HICARD 256KB/512KB MEMORY BOARD FOR IBM-PC's AND COMPATIBLES...

- Expands DOS to 704KB
- Supports all your application software (no upgrades required)
- Works with EGA, networks, accelerators
- Compatible with Rampage, AboveBoard, and other memory expansion
- Fills conventional and extended memory
- Top off a PC-AT to 704KB of DOS... plus

### Advanced Features

- Install and execute RAM resident programs, network drivers, and other control programs above 640KB
- Multiple print spoolers support up to 3 parallel printers simultaneously while you work
- Multiple RAM disks can be installed and sized as required
- **Programmers:** Install and execute Code in HiPage™ above DOS

*It's not how much you have, it's how you use it!  
Take a closer look and see what the HiCard  
Memory Board can do for you.*

**2 Year Warranty on Parts & Labor**  
**Made in U.S.A.**

COMPATIBLE WITH IBM PC/XT/AT AND COMPATIBLES  
RUNNING DOS 2.0 OR LATER

\*HiPage Utility Software included

A Magic PC program looks as simple as this. To design an application you quickly fill-in menu-driven decision tables without having to write a single line of code. For example, just by highlighting the Execute Program operation on this screen and also highlighting the Item List program in the Program Menu, you tell Magic PC to pop-up the Item List window shown in the adjacent screen, when the end-user hits the Zoom key.

Magic PC gives your end-user the power to harness and retrieve data instantly, without any commands or syntax because at runtime you already have built-in options to Add, Delete, Modify, Query and get on-the-spot ad-hoc information simply by highlighting selections from menus. Data validation, security and error-checking are done automatically for you by Magic PC without programming.

## Who needs another DBMS?

At last, Magic PC gives you the ultimate applications design tool, far ahead of 4GLs, DBMS and Application Generators.

Magic PC breaks through the language barrier with the revolutionary Un-Language concept:

**NO PROGRAMMING, COMMANDS OR SYNTAX!**

## Free yourself from your programming language

Magic PC makes you, the professional, completely free from the drudgery of procedural programming. No more cryptic commands, syntax or unforgiving procedural structures, because Magic PC does all the programming automatically. There's your competitive edge. The rest is up to you. . .

## The Professional Choice

Already an international success, Magic PC is a profit maker and career booster for DP Consultants, System Integrators, VARs, MIS professionals, System Analysts, Programmer Analysts and Software Engineers. If you design PC applications professionally, you can't afford not to Un-Language now.

**IBM France:** "IBM encourages this introduction and can not help but salute such evolution. . ."

**Israeli Air Force:** "We were convinced that it was not possible to have a design tool powerful enough to implement real-life applications without a programming language. Magic PC changed our mind. . ."

**Jeff Duntemann, PC Tech Journal:** "It's probably the best integrated database applications and screen generator that I have ever seen. . . very smooth system, and smoothness comes at a premium these days. . ."

## The Magic PC Secret

You're so much more productive with Magic PC because there is **absolutely no programming** to slow you down. You design a Magic PC application by simply filling-in the **Data Dictionary Tables** (Files, Fields, Keys) and the **Task Description Tables** (Operations and Expressions).

Only 13 design **Operations** harness the power of Magic PC. Operations are specific enough to eliminate the need for tiresome syntax, yet elastic enough to produce robust custom applications. Use the Operations to describe **what** you want and Magic PC makes it happen. It's that simple.

Make Task nesting power available with a single **Execute Task** Operation. This powerful instruction triggers Magic PC to execute and display additional tasks or even external applications through **Window Zooms**. The 3-dimensional effect of Window Zooming lets you probe deep into your application through nested windows and manipulate the data underneath.

You describe a Magic PC Task or Program (composite Tasks) by filling your system analysis flow into the Task Description Tables. Choose the participating Data View, and Magic PC executes your desired Operations. You interface with the Tables by highlighting your selections from pop-up menu-driven windows. There's nothing to edit except your headings.

You're not confined to any particular design sequence as you are with most procedural languages. You can enter and change any Table spontaneously, on the fly, as ideas come to mind and Magic PC automatically maintains the application integrity.

A **Magic Inference Engine** automatically orchestrates your Task Description Tables into a single file of internal **Knowledge Base Rules** for optimum, bug-free performance. Knowledge Base Rules are executed by the **Magic Run** engine for stand-alone runtime operation, or by the **Magic Lan** engine for unrestricted Novell network sharing. You're free to design the Knowledge Base without worrying about the internal structure.

Discover fast,  
language-free  
programming  
at no risk  
for only \$ **19.95**

See for yourself how fast you can program language-free applications with our low-cost limited offer.

You'll get the full Magic PC software unprotected and limited to 100 records and 450 page documentation complete with a **free** Order Entry sample application. You'll also get our **free** telephone support for 90 days!

And your \$19.95 will be credited towards the full \$695 Magic PC purchase price. Even if you don't buy Magic PC right away, keep your \$19.95 Magic PC Trial as your application prototyping tool at this bargain price.

## Our No-Risk Guarantee!

You have our no-risk 30-day money-back guarantee: if you're not completely satisfied for any reason, even Magic PC Trial for \$19.95, send it back for a refund.

A Data Manager for

# Custom Reports

PHOTOGRAPH • DOV JACOBSON

*The Data Edition and Reports+ modules of IBM's Personal Decision Series form a partnership that can manage files, generate reports, and develop custom applications.*

DAVE BROWNING

Central to IBM's eight-program Personal Decision Series (PDS) for personal information management is a data management module called Data Edition. By itself, Data Edition is a single-file manager of modest data storage capabilities, but when combined with the PDS Reports+ module, the two products enter the arena of data managers with application development potential. BASIC programs generated by Reports+ provide reporting capabilities, including the combining and updating of multiple files, and can be tailored to support custom applications.

Data Edition is integral to the use of all other PDS programs. (Other modules in PDS address the functions of graphics, planning, word processing, and interfacing to IBM mini- and mainframe computers.) It is provided on three diskettes, with asynchronous communications on a fourth. Reports+ is provided on two additional diskettes. Neither program is copy protected.

Data Edition may be installed on any diskette-based system with a minimum of 256KB of memory, but a hard disk is highly recommended. An 80-column-by-25-line monitor (color or monochrome) is required. A printer, asynchronous port, and full duplex modem are optional. The documentation refers to the numeric coprocessor, but IBM does not make clear if the coprocessor is used if available.

The installation program checks CONFIG.SYS and modifies it if necessary to include a FILES=24 statement. A FILES statement with more than 24 files specified is not changed. The installation procedure also checks to see that BASICA.COM and COMMAND.COM are available on the root directory of the hard disk. The IBM version of the BASICA.COM program is not required,

so Data Edition should be installable on compatible machines. However, interpreted BASIC programs generated by Reports+ do not run on compatibles because a binary program is made available at a specific address and called using the CALL statement.

Although IBM's documentation does not specifically state that Data Edition and Reports+ run only on IBM machines, it always assumes the system is operating in an IBM hardware environment with DOS 2.x or 3.x. A patch must be applied to correct an existing bug in COMMAND.COM in order to run Data Edition under DOS 2.0; other versions of DOS do not need modification. A procedure for applying the patch using DEBUG.COM is included in the installation appendix of the Data Edition documentation. In a concession to purchasers using non-IBM printers, Data Edition includes parameters for specification of alternative control character sequences for common printer settings such as print style and page length. These parameters may be modified from a menu in Data Edition.

Besides updating CONFIG.SYS and checking for the existence of BASICA and COMMAND, the installation procedure installs six programs and batch files on the hard-disk root directory. A subdirectory, PDSCMD, is created and loaded with PDS system executable, overlay, parameter, and configuration files. A library subdirectory is also initialized to contain PDS definitions, data files, and procedures. A tutorial, which includes a complete application with file definitions, data, procedures, and programs, also can be installed. A section in the documentation corresponds to the tutorial program.

Documentation consists of one volume each for Data Edition and

Reports+. The books are presented in the familiar gray, 9-inch-tall, three-ring IBM binders and boxes except that the binders are 11 inches deep instead of the usual 8 inches. Page size is 8½ by 8½ inches. Quick-reference cards are provided with each program.

The documentation is of the how-to-use variety often produced by IBM. Details of underlying concepts and program implementation are not discussed. The "Using" section of the manuals is divided into subsections by task definition. A typical subsection includes discussion and examples of screens and option selection, common uses of the task, what the user will need to know in order to complete the task (such as names of fields to be used, sequence of records desired, calculations that will need to be made, etc.), and some "what if" questions that might arise during the performance of the task.

The appendixes include sections on installation of the program or module, installation of tutorials, updating DOS 2.0, unusual operations (such as transferring data using DIF formats), descriptions of data types in alternate file formats, and so on. A glossary provides substantial information and additional detail on several subjects discussed in the "Using" section.

A separate section lists error messages, which are divided into three categories. PD messages refer to operations performed by the Data Edition module of the PDS system, such as "PD090 File Name is missing" or "PD108 MAINTAIN LIBRARY ended." Some messages indicate errors, others are for information only. PD messages with return codes indicate problems for which Data Edition cannot specifically identify the cause, such as a corrupted file internal structure that might have been due to a

power failure or a computer malfunction. B.RC return codes indicate errors such as incorrect file numbers in the BASIC program generated by Reports+.

Overall, the documentation is excellent and closely matches the program operation. A technical section or appendix on the details of the underlying design and structure of the programs that make up the PDS system also would be helpful.

Data Edition and Reports+ each have a 90-day warranty against defects. A pamphlet describes support service. Problems must be reported in writing, for which a reporting form is provided in a utility program (which automatically includes the package serial numbers, versions, and levels on the printed form). In addition, IBM offers optional extended support service at various levels for an additional fee.

## FILE TYPES

Data Edition recognizes and works with several data file types and field data types. Each file to be used with Data Edition must be defined in terms of file type and record structure. A file is named using DOS rules, and it can include a path. An optional description of up to 40 characters also can be specified. The available file types are: indexed, direct, text, BASIC sequential, DIF256, DIF128, and DIF96.

The program's internal files are of the indexed type and are stored in an unspecified internal ISAM (indexed sequential access method) structure. Direct files are fixed-length record files where record number is used for retrieval, as in BASIC random files. Text refers to fixed-field position files with CRLF record separators; Tab characters are accepted in TEXT files. The BASIC sequential file type corresponds to delimited files produced by BASIC or other programs. Comma field separators are required, but quotes around text fields are necessary only if the fields contain commas; the separator character must be a comma. DIF256 specifies a data interchange format file with translation of all ASCII characters. In addition to specifying format, the DIF128 and DIF96 file types perform character translation on export into the smaller 128- and 96-character sets required for some applications.

Files are imported and exported by copying from one file definition to another. Several Data Edition operations may be performed directly on some non-PDS files without conversion.

Error messages indicate that direct files can contain no more than 64KB

**TABLE 1: Supported Data Types by File Type**

DATA TYPE	INDEXED	DIRECT	TEXT	BASIC SEQ	DIF

D Double precision Business BASIC	● <sup>a</sup>	● <sup>a</sup>	○	○	○

● = Yes ○ = No  
<sup>a</sup> This data type is available for all tasks that support that file type except Enter Data.

Data Edition supports several different file and data types; fields that are specified for each file definition must use appropriate data types and sizes.

records; other files are limited only by disk space and DOS limitations. Up to 11 indexes can be specified on a file, using single fields as keys. Any number of sort sequences can be defined on a PDS file. The sort definition pointer file contains record numbers of the data file records and can be restricted to a subset of the file. Indexes are automatically updated when data change; sort files must be rebuilt by command.

Fields are specified for each file definition using the appropriate data types and sizes. The number of fields allowed in a Data Edition file depends mainly on available memory. Appendix B of the Data Edition manual indicates that 40 to 100 fields may be defined in various circumstances. That appendix also provides a table that can be used as a planning guide to determine the approximate number of fields allowed in a file definition. Field data types for PDS files are character, numeric, structure, position, and skipped (or reserved). Other data types include end-of-record, ASCII numeric, integer, BASIC single and double precision, and Business BASIC single and double precision. Some data types are specific to some file types. No data types are available for date or time information. Table 1 shows which data types are supported by which file types.

Character fields (data type C) can have a maximum size of 40 characters, a serious limitation for many applications. Numeric fields (data type N) can be up to 14 digits. In indexed or direct files, numeric fields are stored as eight-byte floating-point numbers; in text or

BASIC sequential files they are considered ASCII numeric fields of the length specified. Format information for numeric fields is used for display and rounding. Skipped fields (data type X) are used to reserve a number of positions in the record layout.

Structure fields (data type S) redefine subfields; for example, a date field could be defined as S6 with three C2 subfields for year, month, and day. Structure fields still must adhere to the 40-byte length limitation. Position fields (data type P) specify the starting position of the next field in a record or pad records to a specified length. This is useful when matching subfields in a direct file. An end-of-record field (data type E) specifies the CRLF end-of-record sequence in BASIC sequential files. Two-byte integer, four-byte single precision, and eight-byte double precision BASIC fields (data types %, !, and #, respectively) match the numeric data types of IBM BASIC direct files. For Business BASIC, four-byte single- and eight-byte double-precision formats are matched by the B and D data types.

When a field is specified in a file definition, data verification also can be designated. Three types of data verification are provided: a table of specific values (for character fields only), a range of acceptable values (for character or numeric fields), or a mask (for character fields only). Table and range verifications may specify whether uppercase or lowercase treatment is significant for character fields. During data entry, table verification values may be selected using the rotate function keys.

(see photo 2). The entire verification table for a field is limited to a total of 40 characters, including the verification scheme code and value separator characters; this is a serious limitation of the Data Edition module.

A verification table consists of a delimited list of acceptable values preceded by a flag that indicates whether letter case is significant. An example of a verification table is "T,,male,female." If the initial letter *T* is made lowercase, then lowercase letters will not match uppercase letters; otherwise all letters are treated as uppercase. The value separator character is the first character following the code, a comma in this example. The null first table check value permits the field to be left blank.

Range checking is specified using the format "R,low value,high value." As in the verification table, the case of the code letter *R* determines if the case of character data is significant. Either low or high value may be left null to inhibit checking of one end of the range.

Masks are used to specify special character arrangements, as in "m,(###)###-####" for telephone numbers. Masks are valid only for character fields, and special characters must be manually skipped over during data entry. The mask characters are: # for digit 0-9, !

for upper/lowercase letter, % for letter/digit/blank, and \ accepts any character. Any other character is a literal.

Data verification rules can be set up within the file definition and remain in effect until the file definition is changed. These rules are displayed when data entry is performed, and they can be added to or modified for the data entry session. Screens defined in programs generated by Reports+ can include different data verification rules.

Multiple file definitions can apply to a single file as long as the key field remains the same and all commonly defined fields correspond in both order and position. Position fields can be used to skip fields. The primary use of a second file definition is to restrict the number of fields used by a report or process. This reduces the amount of processing required to convert the data between storage and processing format and thus improves performance.

File definitions may be modified or used as the starting point for any subsequent definition. Changes to field names in file definitions must be manually carried over to associated sort and index definitions. Changing field sizes, other than increasing numeric display widths, requires the file to be copied to a new definition from the old definition

in order to preserve data integrity. Conversion of a field between the character and number data types can be accomplished by copying the file from one definition to another.

The definitions of data files and index files and additional index definitions, sort definitions, programs, procedures, and asynchronous lines are stored in a library subdirectory. The definitions can be printed, copied to another library, or erased.

Internal PDS-format indexed files require that one field be specified for the index. Up to ten additional indexes may be added later, but as soon as all index definitions have been used, no more additional indexes may be defined even if some of the previous definitions are removed. Only one DOS file corresponding to the primary index key is created, so the additional index definitions apparently are stored in the library and/or the data file.

The internal ISAM data file structure is not specified, but examination of the file shows a header area and an area between each record where bytes are used for storage other than data. Index reference information appears to be stored in the data file header, which must be modified each time another index is defined. Each additional index

## StatPac Gold™

### POWERFUL STATISTICAL ANALYSIS AND FORECASTING SOFTWARE

*StatPac Gold* is the most advanced statistical analysis package available for your PC. It's been proven in business, government and academic communities for more than six years.

*StatPac Gold* is powerful and easy to use. A comprehensive programming language gives you complete control over your data. Perform complex transformations and sophisticated analyses with speed and accuracy. Produce customized tables and outstanding presentation-quality graphics.

*StatPac Gold* uses sequential ASCII files so it's compatible with most other PC software. Time-series analysis and quality control options are also available.

*StatPac Gold* is the best statistical analysis package you can buy—a high-quality product for professional applications.

Data are entered into fields on a tabular display. The layout of the standard data entry screen cannot be modified; however, entry codes for data verification can be changed.

definition is a separate process, so a file set up with several index keys can take some time to prepare, especially if it contains data. Index keys are single fields, but the structured data type may be used to split or combine adjacent fields for indexing. An index can be specified to be unique or to allow duplicate keys. To access a file in a secondary index sequence, the index definition is selected by name.

Sorts are defined separately in a manner similar to that in which additional indexes are specified. However, sorts permit up to ten field names to be identified for each sort definition, and each field in the sort can be sequenced in ascending or descending order. Also, record selection criteria can be specified using the Data Edition query screen to limit the records that are sorted. Sorts must be reexecuted after any data change in the data file and after the definition of an additional index.

### TASK CHOICES

PDS operation depends on a system of menus and tasks. The main PDS screen, as shown in photo 1, includes a box for a list of task choices associated with one of the menus installed in the system. Task choices for a specific menu are displayed in the left-hand box on the screen as a pointer is moved through the list of menus in the right-hand box. Tasks may be combined in chains to form procedures.

Under the FILES Menu are the tasks associated with creating, modifying, and retrieving data from files: Define File permits manipulation of file definitions; Define Sort manages the modification of sort definitions and the execution of the sort to build the sort file; Define Add'l Index permits the creation of additional index keys to a

data file; Enter Data provides for adding to and changing data in a data file; Query File manages the file query and reporting function of Data Edition; and Copy File is used to import, export, and manipulate data files.

The APPLICATIONS Menu lists the tasks used for defining and executing procedures and programs: Define Procedure manages the creation and modification of procedures, which are groups of tasks with optional parameters used to automate routine operations; Run Procedure executes a pre-defined procedure; Define Program executes the Reports+ module for the creation of BASIC source language programs; Run Program executes previously defined external programs, including BASIC source code under the BASIC interpreter, DOS .COM or .EXE programs, and .BAT files.

Two tasks are found under the UTILITIES Menu: Set PDS controls the PDS system configuration parameter options; in addition, it creates, switches, and erases PDS libraries. Maintain Library manages files (except data files) in the PDS libraries.

The COMMUNICATIONS Menu has tasks for defining and executing asynchronous communications sessions.

Because Data Edition has no command language or operations that can be used to alter multiple records in a file in a single process, the Copy File task under the FILES Menu becomes the workhorse for data manipulation. Both the source and target files must be defined to Data Edition using the Define File task before a copy can take place. External files used for data import must be defined as well as the internal files receiving the data. Instead of a file definition for the source file, Copy File accepts the name of a predefined index

definition or sort definition. Using an index definition causes the processing of all records in the source file in the sequence of the index key field, whereas the use of a sort definition restricts the processing to only those records included in the sort (which may have used record selection to define the sort file as a subset of the original data file).

Transformations that can be performed during the Copy File task include definition of virtual calculated fields, selection of records to include or exclude from the source file, specification of source/destination field matches, modifications of format and conversion between character and numeric data types, and replacement of or appending to records in the destination file. With DIF files, no transformation processing beyond the use of index or sort definitions on a non-DIF source file can be performed during the copy process.

A table of calculations with up to 20 numeric calculation definitions can be specified for the process. The table contains four columns: the name of the calculated field, the first field name or value, the operator, and the second field name or value. Each calculation result is placed in the calculated field name (really a virtual field), and calculated field names can be used as values in subsequent calculations.

In addition to the four standard arithmetic operators (+, -, \*, /), a percent operator calculates the percentage one number is of another, a variance operator computes percentage difference between two values, a blank operator provides simple assignment (used to change field names for reporting), and a crossfoot operator sums all numeric fields (including virtual fields) between two given fields. The calculations are performed on a record-by-record

## DATA EDITION AND REPORTS+ OVERVIEW

### Data Edition with Reports+ 1.0

IBM Personal Decisions Series  
IBM Corporation, P.O. Box 2328  
Menlo Park, CA 94025  
CIRCLE 365 ON READER SERVICE CARD

**Product description.** Data Edition is a file-oriented data management program designed for general stand-alone use or to support a family of additional programs in the Personal Decisions Series, such as Reports+. The Reports+ module extends the capabilities to include multiple-file manipulation and BASIC source code application program generation.

**IBM PC environment.** Data Edition runs on an IBM PC running DOS 2.0 or later, with 256KB minimum (additional memory is used if available), two diskette drives or one diskette and one hard-disk drive, and a monochrome or color monitor. BASIC programs generated by Reports+ will not execute on non-IBM computers in interpretive mode, but they will execute if they are compiled.

**Other environments.** No other environments are supported.

**Network support.** A network version is not available.

**Copy protection.** The product is not copy protected.

**Documentation.** A single volume (9 by 11 inches) is provided for each module; the documentation includes an extensive tutorial section, reference section, appendixes, glossary, messages, and a quick-reference guide.

**User interface.** Control is provided by task menus rather than by direct command interface. Data entry screen layout is fixed unless Reports+ is

used to create custom screen programs. The use of function keys is consistent throughout. Keys F9 and F10 rotate values through data input field when a list of values is available.

**Help facilities.** On-line, context-sensitive help is available using function key F1.

**File capacities.** File capacities are not specified. Number of fields per file varies with the available memory and complexity of queries and reports.

**File types.** Internal ISAM, BASIC sequential (comma delimited) with or without CRLF record marks, text (column-oriented fixed field length), direct (fixed-length records accessed by record number), and DIF file types are provided. Many operations can be performed directly on external file types without conversion.

**Fields and capacities.** Character (up to 40-character maximum field length), numeric, skipped (placeholder), structured (collection of subfields), position, end of record, ASCII numeric, integer, single and double precision, and Business BASIC single and double precision fields are supported. It does not offer date or time data types.

**Data entry.** Only fixed-format, field-by-field data entry screen is provided.

Limited range and table data validation checks may be defined.

#### Application development facilities.

Groups of tasks may be collected and saved as procedures; programs generated by Reports+ may be integrated into procedures. Applications must be run in PDS environment.

**Security.** Not implemented.

**Access to system facilities.** DOS commands, batch files, and executable files are accessible; external program execution can be integrated into procedure definitions.

**Queries and reports.** The basic Data Edition module permits file, sort, or index definitions to be combined with record selection criteria on single files, with output to screen or printer and up to five total/subtotal levels. Query output on screen may be scrolled vertically and horizontally for viewing. Reports+ module generates BASIC source code for sophisticated report production.

**Utilities.** A library of up to 125 named items (such as file definitions, queries, procedures, sorts, and indexes) is maintained. Each item can have a 40-character description.

**Data compatibility.** The Data Edition module imports or directly operates on the file types listed above. Any file type can be copied to any other file type with some restrictions.

**Distribution.** The Personal Decision Series is marketed through IBM software product distributors and dealers.

**Price.** \$275 for Data Edition, \$165 for Reports+.

**Support.** A variety of paid support service levels are available from IBM.

—Dave Browning

basis; totals or record counts cannot be accumulated. A special name REC# function can be used to retrieve the record number from direct files.

After calculations have been defined, record selection may be specified. Up to 20 tests can be formulated in a table, designated *include* or *omit*. Each row in the table specifies a test (IF, AND, OR), a field name (including virtual fields defined in calculations), an operator (=, <, ≤, <>, >, ≥, C, NC, G), and a field name, value, or character string for comparison. The operator C stands for *contains*, NC for *does not contain*, and G for a *global* comparison using question marks and asterisks as in DOS. Character comparisons ignore let-

ter case. Nesting of comparisons is provided using Data Edition IF-AND-OR logic in accordance with the rules of Boolean algebra. Separate tests are specified by using the IF operator for each, and tests (or groups of tests) are separated with the OR or AND operator.

The lack of parentheses in the logic makes complex conditions very confusing. The documentation gives

```
IF past due > 0 AND bal due > cred lim  
OR past due > 0 AND last pmt < 831231
```

as an example to illustrate the use of a repeated test (past due > 0) in order to clarify the conditions to Data Edition. Another example set of selection conditions using multiple IFs, ANDs, and ORs

is so complex that a test run would have to be made against carefully prepared test data in order to determine the results. In some cases, performing a second file copy operation may be preferable to specifying a nested condition to Data Edition. If a sort definition is used as the source file, any record-filtering conditions defined for the sort restrict the set of records presented to the Copy File selection process.

After calculations and record selection criteria are specified, the fields to be copied are designated. Another table of four columns with the headings From field name, Format, To field name, and Format is used to match fields for transfer. Data Edition fills in

## NEW AND IMPROVED

Version 2

# DISnDATa

- Fully disassembles both .EXE and .COM files!
- Flow- and Seg. Reg. Data-trace finds SEGs, PROCs, & Data Areas!
- Outputs SEGMENT & PROC pseudo-ops at proper places.
- Outputs data areas via proper form of DB/DW (ASCII text as strings, others as hex value).
- Labels both code & data. Labels of form 'Hxxxxx' where 'xxxxx' is hex offset from beginning of program.

### NEW!

- User may easily input locations of multiple pgm. areas (if reqd.).
- 8086/88/186/286 op-codes, ('real' addressing mode).
- DOS function calls commented to show operation performed.

- Output format fully compatible with IBM\*/Microsoft\*\* assembler input.

- For IBM\* PC\*/XT\*/AT\* & compatibles, 128K+, DOS 2.0+.

## DATA AND REPORTS+

the columns with field names from the source and target files and from the calculation specification table. Matching field names in the two files are placed in the same table row, and blank entries are left in the From or To columns if a match is not found. Field matches can be changed to move one field in the source record to a different field in the target record or to match up a character type field with a numeric type field in order to force conversion. Target fields can be positioned opposite a blank source field, and Data Edition will blank- or zero-fill the receiving field as appropriate. Calculated fields can be source fields as well as character literals. Numeric literals can be given a name in the calculation table for subsequent use in the select fields table.

Because Data Edition stores numeric values in eight-byte format, numeric data transfer is not affected by differences in field lengths between the two file definitions. Character fields are truncated or blank-filled on the trailing end to adjust for field length differences. Conversion of character fields to numeric data type follows common rules for taking the value of a string. Numbers converted to characters must fit within the length of the receiving field, or Data Edition will store blanks.

Many data manipulation operations are accomplished by the Copy File task, which can be flagged to add the copied records to the records in the destination file or to replace records in the destination file. If this file is of the direct type, a replacement copy writes the copied records over any existing ones and numbers them starting from 1. If the destination file is a Data Edition indexed file, then it is emptied before the copying task ever begins.

Because test conditions cannot be used in the calculation or field selection tables, a single copying process cannot be used to update a subset of records in the source file, but this procedure can be accomplished with two Copy File operations. The first step would erase the output file and copy only the subset of records that are not to be changed. The second step would select only the records to be changed and add them to the destination file. Copy File cannot combine multiple files into one or update one file from another.

Unlike some data managers, Data Edition allows the copying process to be interrupted. During the copy, the number of records read and the number written are displayed, and the Shift-F8 key combination is used to ask for confirmation prior to aborting. If a copy

is writing records to a file where duplicate keys are not allowed, the process stops at the first occurrence of a record with a key that matches a record already in the file. Records copied before the duplicate was found are placed in the target file. Depending on the selection conditions, a subsequent copy might be defined with the add attribute to continue the copy.

### PROCEDURES AND PARAMETERS

Most, but not all, screens and functions in the PDS system can be used from a procedure, which is a named group of tasks linked together in a sequence. Procedure definitions consist of a 40-character description and are stored in a library as are all other elements in the PDS system. To define a procedure, a list of tasks, such as Copy File, Define Sort, or Run Procedure, is specified. Each task is then defined by filling in the task's screens of parameters as they are presented by Data Edition. To build nested procedures, the Run Procedure task is selected. The depth of nesting is apparently unlimited.

During the task definition process, a question mark either by itself or with a number from 1 to 10 is used to specify a deferred substitute parameter. If the question mark alone is used, Data Edition queries the operator for the parameter's value when the procedure is run. For example, a report may require a sort and query to be performed on a data file that might vary according to the day of the week. The operator could be queried for the data file definition name as part of the procedure when it is executed. Substitute parameters using the question mark with a number are specified in a table at the time of procedure definition. This parameter table, with the values selected when the procedure was defined shown as default entries, is displayed to the operator when the procedure is actually run. The default entries may be either retained or modified.

Nested procedures can use substitute parameters. A procedure using substitute codes ?1 - ?10 uses parameters from the calling procedure to override values specified when the lower-level procedure was defined. An example of using nested procedures would be to define a low-level procedure to be performed daily, an end-of-week procedure that calls the daily procedure before completing its process, and an end-of-month procedure that calls the end-of-week procedure prior to producing the end-of-month report. The procedure tree may be started at any level.

Procedures are stored in a library, along with items such as definitions, files, other procedures, and programs. The PDS system's library management is excellent. Different library subdirectories may be used to separate applications, and common data may be referred to from more than one directory. Each library is limited to 125 items, including the 40-character description entered when the items were defined. When an item is to be selected in other Data Edition operations, the item names and descriptions are presented to the user as a rotate table that can be stepped through using function keys.

The Maintain Library task is used to manage the items in a library. A set of items can be selected by specifying the item type (all, filedef, addindex sortdef, program, proc, async, or file), a specific item name, or a set of item names. Once selected, specific items (except data files) can be printed, copied to another PDS library, or erased.

The Set PDS task is used to create new libraries, select a different library, erase an entire library, and specify printer settings, printer control characters, monitor display attributes, and the default start-up menu. Different default parameters can be saved in connection with different user IDs, which are created by starting PDS from DOS with the command PDS newID. Subsequent executions of PDS with a user ID parameter invoke the default settings for the specified user.

The printer parameter screen includes a setting for a print buffer length. The PDS-managed print buffer, which is specified in multiples of 512 bytes, subtracts from the memory that is available for other PDS tasks. The F7 print key used to print item definitions bypasses the print buffer, so buffered printing should be used with care. Printer control character settings can be specified for normal, compressed, double width, double-width compressed, form feed, six lines per inch, eight lines per inch, and form length. A separate screen is available to set control characters for color printers.

Settings for monitor displays include redefinition of colors and highlights for text and messages on the PDS screens. Users with two screens may save settings for both. A setting for the default menu to be displayed when PDS is started also can be saved.

#### USER INTERFACE

The user interface consists of various screens and menus. In some cases, the cursor control keys can be used to posi-

tion a pointer, as in the selection of a menu on the main screen. In other cases, the user response must be typed into a highlighted area. Selections can be confirmed using either the Ctrl-Enter key combination or the plus key on the numeric keypad.

A consistent definition of function key assignments is maintained throughout PDS. A list of active function keys is displayed at the lower right-hand corner of the screen: F1 produces a help window when appropriate and pages through the help shown in the window; F5 toggles a list feature, which captures PDS definitions as work is accomplished and prints them when the task is exited; F6 and Shift-F6 insert and delete items; F7 is an immediate print of the currently selected item; F8 is used to return from a subfunction, and the Shift-F8 combination either aborts a process without saving changes or ends a function with changes saved, depending on the operation in process.

A highlighted, uppercase R indicates when the rotate keys are active. When PDS expects the user to select a value from a defined list of options (whether displayed or not), function keys 9 and 10 rotate the list of options through the user input box. F9 moves the list in one direction, F10 moves it in

the reverse direction. The rotate feature is convenient for selecting items when working with file definitions from the list of files, and it also is used to select items from data verification tables assigned to field definitions in files.

PDS has a standard data entry screen (photo 2), the layout of which cannot be modified. Entry codes for data verification can be specified or changed for the data entry session, but at the end of the session they revert to the verification settings stored in the file definition. The data entry screen provides for entry of data into fields on a tabular display. Function keys are used to change modes. When in change mode, the key field is displayed below the data entry box, and a new key is presented. If a direct file is being updated, record numbers, instead of index keys, are used for selection.

The basic Data Edition module of the PDS system provides the ability to query and report from a single file. Output may be viewed on the screen, printed, or directed to a file. In addition, queries can be run on direct, indexed, text, or BASIC sequential files.

For PDS files, a file, index, or sort definition can specify the input data file. Sort definitions can restrict the scope of records retrieved from the underlying

### TURBO POWER FOR BASICA & QuickBASIC!

Array processing subroutines and 8087 speed  
For IBM PC/XT/AT or Compatible.

**\$150**

#### Introducing VECTOR87

A building-block math library\* of 312 assembly vector and matrix subroutines for the BASICA interpreter & QuickBASIC™ compiler

#### ✓ HIGH SPEED & LOW COST

- Native 8087 assembly code
- 20-50 fold speed increase
- Faster than compilers
- Less than 50¢ each

#### ✓ VECTOR MATH

- Algebra & transcendentals
- Statistics, polynomials
- Data merges, comparisons
- Histograms, logic

#### ✓ MATRIX & ARRAY MATH

- Inverse, transpose
- Matrix multiply
- Linear equations
- Matrix to vector map

#### ✓ COMPLEX VARIABLES

- Define complex vectors
- Complex algebra, trig
- Fast FFT (1024-2.5 sec)
- Over 40 subroutines

\* Loads outside BASICA, requires 8087 or 80287 coprocessor and 640K memory, "CALL" from BASICA, not copy protected

**MAGIC SOFTWARE, INC.**

7941 Paseo del Ocaso

La Jolla, CA 92037

\$150 (BASICA + QuickBASIC), \$130 (BASICA), add 5% CA tax

data file as well as designating a sequence. When directing output to a printer, the default print style of normal or compressed specified by the Set PDS task can be overridden. Final totals and up to four additional subtotal levels can be specified. A query title of up to 40 columns can be assigned and is stored in the library if the query is saved as a procedure. Query output is column oriented, and output can be tailored to include title and column headings, to display summary or detail, to select fields and arrangement to be displayed,

to specify column width and spacing, to calculate virtual fields for interim use or output display, as well as to skip lines and eject pages.

Record selection uses the standard IF-AND-OR logic of the PDS system by which records can be selected for inclusion or omission in the output report. Calculated fields, which are specified under the Copy File task as described above, may be used in the record selection criteria. The predefined REC# function incorporates direct file record numbers for record selection and out-

put. Two character fields can be trimmed of trailing blanks and joined with zero or one space between the results when the output is directed to a file or the printer. Literal symbols such as the vertical bar (|) are used for output formatting. During the output tailoring process the F2 function key can be used to compute the current width of the report to reduce the time spent testing reports on the printer.

When Data Edition files of the indexed or direct type are the source for a query and output is directed to the screen, the PgUp and PgDn keys can be used to scroll forward and backward through the output. This is not possible for other file types. Horizontal scrolling of output that is too wide for the screen is permitted. During scrolling of a query output, the F3 function key can be used to display a table that shows all fields in a selected record; F7 can be used to print the table.

The standard query and report functions that are provided by the basic Data Edition module produce attractive column format reports with reasonable calculation and subtotalling options from within a single file.

## AN ADDED DIMENSION

When the PDS Reports+ module is installed with Data Edition, an additional dimension of data management is thus added to the PDS system. Reports+ is a source code generator that produces BASIC language programs to operate in conjunction with PDS data files. Programs that provide for multiple file access, user-defined screens, and substantial output formatting may be produced without additional user programming. User-tailoring of programs produced by Reports+ can add more complex calculations, determine alternative processing sequences, and provide specialized error processing.

Reports+ is accessed from the PDS system by selecting Define Program from the APPLICATIONS Menu. As with all PDS tasks, program definitions are stored in the library and may be modified or used as a starting point for new program definitions. The usual 40-character description line is available to help identify existing program files as they are rotated through the selection box on the Select Program screen. Once a program has been selected or a new program name entered, a screen of seven options is presented: Select Files, Specify Summary Breaks, Specify Forms Control, Define Report Format, Define Screens, Enter BASIC Statements, and Build Program and End. In addition to

# Command Plus: What Command should have been.

Command was fine when it came out. But when it came out again and again and again with few substantial changes, it became a real roadblock for efficient programming.

Well, we always thought the programmer should be in command. So we designed Command Plus. An eminently reasonable shell that replaces MS-DOS® Command.

You don't have to forget the commands you already know. And Command Plus gives you an enhanced DIR, COPY and DEL. Plus features like command macros, command recall, file browsing, and lots more that you can't get anywhere else. There's even LOG to help track the time you spend on projects.

You also get Script, a batch processor that's easy to learn and unbelievably powerful. Its Pascal-like language includes control loops, conditionals and variables which let you create unique system utilities. Hassling with batch files is a thing of the past.

If you think you'd get more done if you were in command of all this, get Command Plus. It's even within a programmer's budget at \$79.95.

To order or for more information, call us at (800) 992-4ESP. In California, call (213) 390-7408.

VISA and MasterCard accepted.

11965 Venice Blvd., Suite 309, Los Angeles, CA 90066

MS-DOS is a registered trademark of Microsoft Corporation.

ESP

SOFTWARE SYSTEMS INC.

these options, Reports+ can be directed to use either the report or the freeform program skeleton and to produce code either for the BASICA interpreter or the IBM BASIC compiler.

The Select Files option includes the specification of files and fields to be used, input and output methods, calculations to be performed, and records to be selected. Up to six files (F1-F6) previously defined to PDS may be selected for use by the program. For each file, the input method is specified as sequential, random, demand, or blank (not used for input) and the output method as update, add, demand, or blank (not used for output).

The update output method makes changes to existing records. A record written to the output file after a successful read causes the record to be updated; otherwise, a new record is added to the output file. The add output method allows adding to the file only. An input method cannot be specified for output files using the add mode. The demand output method requires that user code execute a B.WRITE request when output is desired.

For input files, options may be executed for the selection of fields and records and the definition of calculations. The usual PDS screens are used to support these options. Up to 200 fields may be selected for a program, including file and calculated fields.

The Specify Summary Breaks option permits up to five summary breaks with summary line titles. The break fields may be selected from file fields, calculation fields, or a BASIC variable name to be manipulated by user code. A special field name EOF is used to select processing that should occur at the end of the program. In addition to report output formatting, summary breaks can be used to determine when special processing, such as updating or adding records to files, should occur.

The Specify Forms Control option uses a screen to collect specifications for printer control elements, such as lines per inch, form size, print style, output file name, printer ID.

Under the Design Report Format option, which supports the definition of the output report layout, line types are available for header, detail, summary leader and summary lines, footers, and user lines (printed with user code B.PUSER statements). Each line is defined with line skip spacing, print style, text, and field locations. Colors may be selected for color printers. Formatting symbols specify field locations and print formats. Special value types for current,

## STREAMLINE YOUR PROGRAMMING

CIRCLE NO. 174 ON READER SERVICE CARD

subtotal, average, running total, and previous can be assigned to formatting symbols to designate the source of the field data to be printed.

Ten screens (S1-S10) can be defined and used in the program with the Define Screens option. Screen definitions are saved within PDS, and a 40-character description can be assigned for future reference. Screens can be designated for one-time display at program initialization (to collect starting values or parameters) or on demand based on B.SCREEN or B.INVSCREEN requests in user-added BASIC code statements. The Reports+ module provides cursor control scrolling.

Screen sizes can be larger or smaller than the monitor display size. Screens that are smaller than the monitor display can be positioned anywhere on the monitor. The screen format is painted on the blank screen, colors are selected, and formatting symbols used for up to 50 fields on a screen. The sequence in which the cursor moves from field to field can be specified, and the data verification rules described above for Data Edition can be used for fields that accept data. Field alignment (left, right, or character left/numeric right) also can be specified.

The Enter BASIC Statements option invokes the BASIC interpreter for editing the Reports+ program skeleton. After user code is entered, the program is saved and control returned to PDS. Build Program and End completes the program generation process by merging user code into the program built by Reports+ and saving it as a BASIC ASCII file with the extension .@BS.

The Define Program task allows the user to generate sophisticated report and data management programs using Reports+ without additional programming. Multiple files can be linked, data from one file can be used to update another, data from multiple files can be combined into one, and special screens can be defined to display data and accept data entry. The incorporation of BASIC statements into the program is necessary to access up to two additional non-PDS BASIC files, rearrange the sequence of program processing, add complex calculations, and perform specialized error processing.

Data Edition's Run Program task executes programs generated by Define Program. If the program is generated in the interpreter build mode, the BASICA interpreter is called in to perform the execution. For programs generated by

Reports+, additional parameters can be specified to override the printer destination ID, redirect the output to a file, set parameters, and specify alternative file names to be used in the program. Another option for interpreted programs is to select execution in a test environment. This means that control remains in the BASICA interpreter instead of returning to PDS upon program termination, a useful feature for debugging user-generated code statements.

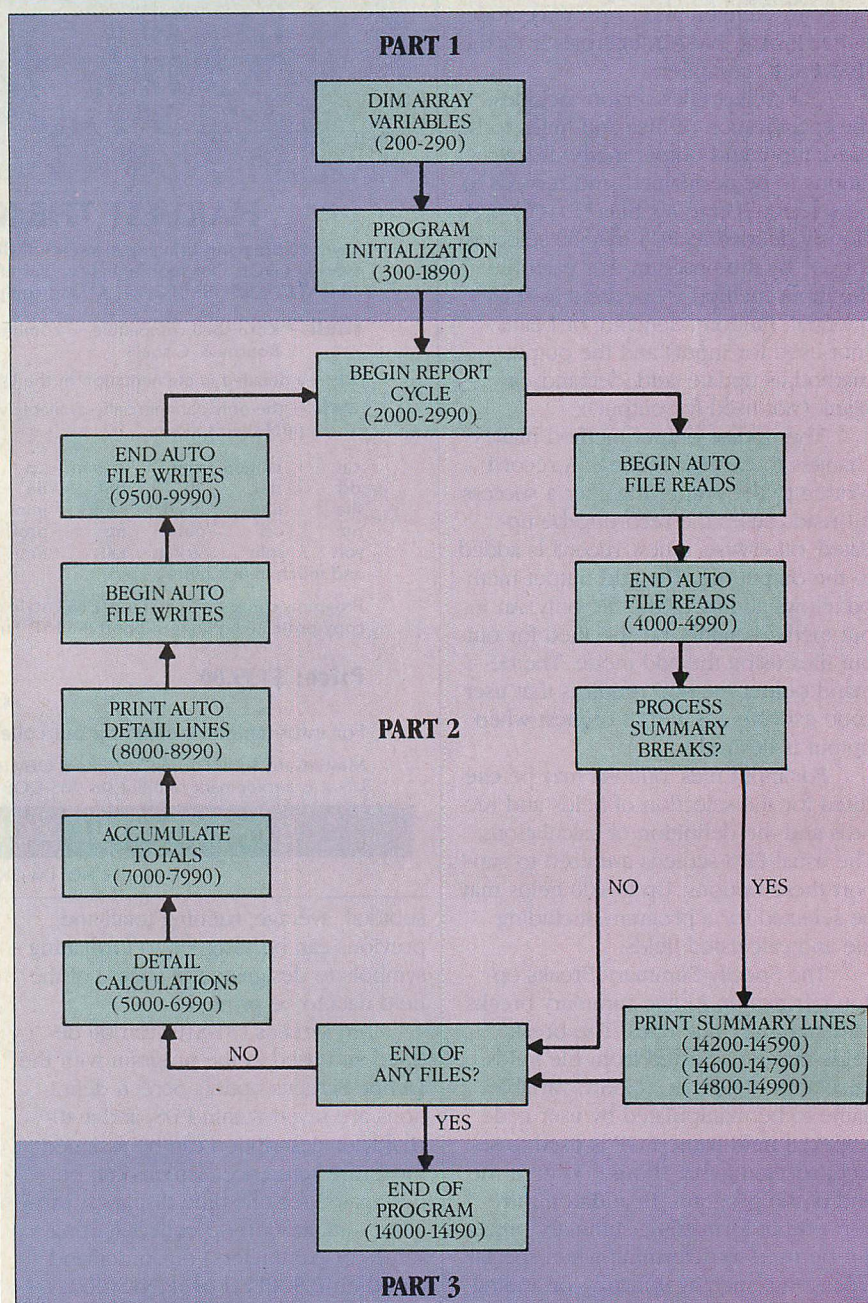

Tailoring of programs produced by Reports+ can be as simple as the addition of one or two statements to define additional calculations for a summary total in a report program skeleton or as complex as the development of a complete program within the Reports+ freeform skeleton. Programs can be compiled with the IBM BASIC compiler for improved performance.

The modification of a report format skeleton is straightforward, once the underlying concept is understood. The report program skeleton has three main parts: initialization, report process cycle, and final processing, which performs any special processing required at program completion and closes files. Initialization consists of two sections, one to dimension arrays and the second to perform tasks, such as initializing variables, establishing printer controls, assigning default and runtime parameters to variables, and displaying screens.

The report process cycle is divided into the following steps:

- **Begin report cycle** performs any processing, such as variable resetting, that must be done at the beginning of each report cycle.
- **Begin auto file reads** performs the read operations for sequential and random files and checks selection criteria until a record passes the tests; no user code can be entered.
- **End auto file reads** is executed after input has been accomplished; user code can be entered in this section to control the reading of files specified as demand input; other calculations such as special summary breaks can be entered in this section.
- **Process summary breaks** checks to see if any predefined break conditions have been met. If any have occurred, the program branches to subroutine sections for calculations prior to summary printing and prior to each level of printing, where user code may be incorporated. The predefined summary line is printed, and the section for calculations after summary printing is executed. After break processing, the program checks to see if an

**FIGURE 1:** Report Program Control Flow

The Reports+ report program skeleton consists of three main parts as indicated above: initialization, report process cycle, and final processing.

end-of-file condition has occurred and, if so, branches to the final processing part of the program skeleton.

- **Detail calculations** performs calculations such as accumulation of totals or preparation of detail output data.
- **Accumulate totals** calculates predefined totals such as subtotals, averages, or running totals.
- **Print auto detail lines** prints the report detail line and any user-defined lines to be printed with the detail.
- **Begin auto file writes** is executed next to perform any automatic file

updating that has been specified in the program options; user code is not allowed in this section.

- **End auto file writes** permits user code to be specified for additional file output manipulations. This section also ends the report cycle, so any additional steps to be completed at the end of the cycle are programmed here. The program then loops to the beginning of the report cycle.

Figure 1 is a diagram of the program control flow. In a freeform program, the user must specify the se-

The freeform skeleton is a subset of the report skeleton. The user develops the processing sequence in the freeform calcs section.

quence of processing, using the thirteen requests and two functions available from Reports+. The two functions, GET and REPLACE, manage summary and line count variable data.

A request is a call to a subroutine after setting a variable to perform a specific function such as reading files or printing lines. The requests are: B.ADDSUM to accumulate totals and record counts, B.CLOSE to close files, B.INVSCREEN to display and read a screen, B.LASTREC to save values from one record for processing of the next record, B.PDETAIL to print detail lines, B.PROCPARM to manage runtime substitution parameters, B.PSUM to detect and print summary breaks, B.PUSER to print a user-defined line, B.READ to read a record, B.REPEND to end the program, B.SCREEN to display and read a screen that has complex screen operations, B.SKIPLINE to force line skips, and B.WRITE to write or delete a record.

About four dozen variables used by Reports+ in the generated program are available for user query and modification (not all variables). An example is the B.LASTLEV variable, which contains a number (1-5) corresponding to the summary break level that just occurred when in the process summary breaks section of the program.

The freeform program skeleton, shown in figure 2, is essentially a subset of the report program skeleton. The programmer is responsible for developing the processing sequence within the freeform calcs section. All file input and output must be in the demand mode and is accomplished using the appropriate predefined request subroutines. Screens can be manipulated using the request subroutines just as in the report format program.

When Reports+ builds a program, it generates program statements within the requested skeleton in response to the options specified by the user. The

user code is merged with the generated program to define the complete program. Because Reports+ makes use of predefined line numbers for user code sections, changes can be made to a previously developed program without destroying user code. The resulting BASICA program is stored in ASCII with the .@BS extension. It is not stored in line number sequence because the BASICA interpreter sorts on line number while loading. When using the program in the interpreted mode, it can be saved in BASIC tokenized form, which speeds up the loading and storing process. Before a generated program is compiled, it must be loaded into BASIC and resaved in ASCII to sequence the line numbers properly. The program should not be renumbered.

Because BASICA does not read the internal PDS ISAM file format directly, PDS must be used to provide the input/output interface for the programs. When Reports+ is used to generate a program for compiling, statements are created to call the interface module, PDSSTNG.OBJ, which is provided for linking with the compiled BASIC program. A CALL ABSOLUTE statement is used to access the PDS input/output routines. For interpreted BASIC processing, a binary program, which is available at a specific address, is called using the CALL statement. Therefore, programs that are generated by Reports+ must be run from the PDS system. Both versions of the generated programs check for the presence of PDS and halt with a message that PDS is required if it is not found.

Because of this linkage to PDS, programs generated for interpreted mode execution would not be expected to run on compatible machines using MS-BASICA instead of IBM BASICA. Indeed, they do not run on a Compaq using PC-DOS 3.1 and MS-BASICA. Reports+ programs can be compiled and

will run with PDS on a Compaq, but this makes for a cumbersome development and debugging process.

### APPLICATION DEVELOPMENT

Application development using Data Edition and Reports+ consists of defining custom BASIC programs within the report or freeform structures and integrating their execution into an application using Define Procedure. Applications are subordinate to the PDS structure, and end users must learn the PDS operating environment. Applications for markets other than those using or willing to learn the PDS interface would not be appropriate.

The Reports+ module provides a screen generator function as well as program skeletons. Up to 10 screens can be defined for a program, with as many as 50 fields on a screen. Screens can be larger or smaller than the physical display, and Reports+ manages the user interface for any necessary scrolling. Screens can be integrated into programs as initialization screens, which are automatically presented to the user before the processing loop begins, or as demand screens, which must be scheduled by user code in the program.

Field management on screens can be relatively simple if Reports+ creates the code for the user interface to fields; most applications, however, require a more direct interface between the screen program code and the developer's tailoring code. Data entry validation for fields in screens generated by Reports+ is limited to the restricted table, range, and mask techniques used in Data Edition. Any additional data validation such as look-ups in separate files requires the developer to manage the field presentations within the screen using the B.INVSCREEN and B.SCREEN program functions.

For applications to be used within the Data Edition environment and sub-

ject to the limitations of the Data Edition file structures, custom screen management and report programs are relatively easy to create after the Reports+ development system is learned. Applications that require data validation or file and field capacities beyond those provided by Data Edition will require substantial effort to tailor Reports+ skeletons into suitable programs.

The sample application used by *PC Tech Journal* to evaluate the data managers in this series stretches the PDS capacity and requires substantial effort to define within the Data Edition and Reports+ capabilities. (For a detailed explanation of the sample application, see "Evaluating Data Managers as Development Tools," Julie Anderson, August 1985, p. 46.)

The sample application includes generation of an interactive data entry screen requiring look-up and data validation from two other files, data validation of one field dependent on validated data entered into previous fields, and on-screen calculations. The programming effort for this task is formidable, even within the Reports+ skeleton. Substantial programming effort is required because of restricted field types (no date fields) and field capacities (maximum 40 characters of text).

Implementation of the *PC Tech Journal* application as defined would not be appropriate for the combined Data Edition and Reports+ system. A subset of the sample application, which requires less data validation and accepts the restrictions on field capacities, could be accomplished within the natural use of the tools provided by Data Edition and Reports+.

## BENCHMARKS

The benchmarks for the standard *PC Tech Journal* testing of data managers were run on the same 6-MHz PC/AT in the same fresh disk partition. The results are shown in figure 3. The first benchmark imports a 900-record file from AUTHORASC, the comma-delimited file. Data Edition reads delimited format files directly after a file definition has been prepared, but the restricted operations that can be performed on files of this type mean the file must be imported to the internal Data Edition indexed format. If the fields in the file to be imported contain character data in the desired format, then this is a one-step operation using the Copy File task. However, the AUTHORASC file contains telephone and Social Security numbers without separation characters, and the desired final format uses the

slash (/) and hyphen (-) characters for readability. In addition, a structured field containing the state and zip code fields needs to be established for the creation of the secondary index on this combination for the second benchmark.

Structured fields cannot be defined on delimited file formats, so the first step is to import the file into a format where structured fields can be defined. Because this is an interim file only, the direct format (equivalent to BASIC random format) is selected for improved performance. Writing and reading a direct file in sequence eliminates the processing and input/output effort required to maintain index information. The field definitions in the interim file use structures to combine the state and zip code fields into a virtual **statezip** field. Other structured fields define the digit subgroups in the telephone and Social Security number fields. A second Copy File task is then defined to copy this direct format interim file to the final indexed AUTHORS file.

The final AUTHORS file layout also includes structured fields for the telephone and Social Security numbers, but subfields must be defined to hold the separator characters. For example, the Social Security number field of nine characters in the delimited file becomes a structured field, SSN, of nine characters containing subfields SSN1, SSN2, and SSN3 of three, two, and four characters in the interim direct file. The final AUTHORS file includes an 11-character SSN structured field containing the subfields SSN1, SSN1a, SSN2, SSN2a, and SSN3. SSN1a and SSN2a receive the literal "-" during the Copy File operation. These structures are cumbersome and interfere with many operations, so a third file format might be defined for final production use in order to eliminate the substructures.

For the benchmark test, the file definitions and the Copy File tasks were predefined, and a procedure was prepared to execute the two tasks automatically. The resulting benchmark time is the total for the two tasks.

In a production environment where a delimited file such as AUTHORASC would be imported frequently, it might be more efficient to develop a custom program through Reports+ using the freeform program template. Such a program could read the delimited file directly, and customized statements would perform the field reformatting and specify the writing to the final file format. The execution time for this program would be expected to be less than the total time required for

## HIGH POWER WITHOUT THE HIGH PRICE

Microstat® has been the most popular statistics package for microcomputers since we introduced it in 1978. In the past two years, Microstat has been requested by name on more military contracts than any other statistics package. When it comes to coverage, ease of use, accuracy, and value, Microstat is unbeatable. Just some of its features include:

- Data Management Subsystem for file creation and management
- Data Transformations
- Hypothesis Testing
- Three types of ANOVA
- Simple, Multiple, Stepwise Multiple Regression
- 11 Nonparametric Tests
- Factorials, Permutations, Combinations
- Batch or Interactive Operation
- Read external files (e.g., Lotus, dBaseII, ASCII)
- Descriptive Statistics
- Scatterplots
- Correlation Analysis
- Time Series
- 8 Probability Distributions
- Crosstabs and Chi-Square
- User's Manual

Microstat® is available for MSDOS, PC DOS, CP/M80, CP/M86. The price is \$375.00. Multiple copy discounts and cost-effective site licenses are available.

the two Copy File tasks, but would probably be slightly longer than the time for the second copy to the final format where the index is built. The second copy from the direct to the indexed format took about three-fourths of the total time. Thus, a custom program should reduce the overall benchmark time by up to 25 percent.

The second benchmark requires the creation of a second index on the AUTHORS file, using the combined state and zip code fields. Because Data Edition permits indexing only on a single field, a structured field must be used to define the combination of two or more adjacent fields for indexing purposes. This field structure was specified in the AUTHORS file definition for this purpose. The Create Add'l Index task was used to perform the benchmark.

The third benchmark involves counting unique state occurrences in the state field in the AUTHORS file. Because no function is available in Data Edition for counting records, a custom program was required. The Reports+ report format program was used with a single, tailored BASIC statement added. In the section called calcs prior to each level printing, the BASIC statement

```
STATE.COUNT = B.CNT(B.RUNNING) -  
B.CNT(B.LEVEL)
```

was added at line 14600. This defined a BASIC variable, STATE.COUNT, to be the difference of two program registers provided in the Reports+ program. The array B.CNT held running counts of records read at each break level. The subscripts B.RUNNING and B.LEVEL were also provided by Reports+. In the report format design task, STATE.COUNT was used on a summary line as a variable to be printed, and a break was specified on the state field. This produced the tally output as long as the AUTHORS file was read in state sequence. The program was compiled using the IBM BASIC compiler version 2.0. The /O option was used to create a stand-alone .EXE program not requiring the runtime library. A sort definition task was specified to produce a sort in state sequence, and a procedure was defined to perform the two tasks in sequence for the benchmark test.

In the fourth benchmark the task is to replace all occurrences of the state "CO" with "CL" in the AUTHORS file. This could be accomplished with two File Copy procedures, where the first procedure selects records with "CO" and uses a literal to replace the state field with "CL." The first copy would use the replace option to empty the

**FIGURE 3: Benchmark Results**

The Data Edition and Reports+ combination was faster than average on the first benchmark, but its performance is about average or slower on the remainder.

output file. The second task would select records with "CO" to be omitted from the copy, and the "add" option would be used to append these records to the result of the first copy. To get the records back into the AUTHORS file, a third copy would be required. This approach, while it requires no programming, would be unreasonably long and, therefore, would probably not be used in a production environment.

Therefore, again a custom program with only one line of BASIC code was written under Reports+. At line 4000 in the end auto file reads section, the BASIC statement, F1STATE\$ = "CL," was inserted. The Reports+ options were used to define a program to read the AUTHORS file in sequence and to specify the UPD option to cause the records to be rewritten after reading. Selection criteria in the Reports+ program specification limited the records presented to the custom BASIC code to those records having the state field equal to "CO." The benchmark was obtained by executing the Run Program task from the APPLICATIONS menu.

The final benchmark produces a delimited file of California author records in zip code sequence from the AUTHORS file. A procedure of two tasks was used to create this benchmark. The first task was a sort of the AUTHORS file on the zip field, with record selection criteria limiting the sort pointers to State = "CA" only. The second task in the procedure was a Copy File from the sort definition to the AUTHCAS file, which was predefined in the desired delimited output format.

A second approach was tried for this benchmark as well. An interim file, AUTHTEMP, was defined as an indexed file with the index on zip code. A procedure of two tasks was then specified to copy records from AUTHORS to the AUTHTEMP file for State = "CA." AUTHTEMP was then copied to the delimited AUTHCAS in the second task. This eliminated the need to sort the AUTHORS file. The second copy task took about the same amount of time as the second task in the first approach; however, the first task, copy from AUTHORS to AUTHTEMP for State =

# Complete Communications for Programmers & Engineers for \$95

## Turn Your PC or AT into a Communicating Workstation

ZAP gives you all the communications features you need, plus emulation of graphics and smart terminals. And at a reasonable price! You can use the full capabilities of almost any computer — a mainframe, mini, or just using a BBS . . . unattended. Accessing existing data shouldn't cost you a lot of money.

*ZAP is the most versatile communications package you could ask for. I communicate with a number of mainframe and mini systems and use ZAP to download everything. It is very easy to use.*

*I've bought 4 communications packages. All cost more, and none come close to ZAP's performance. ZAP is now the only package I use.*

— Larry Cole, President  
PC Powerware Corp., Chicago, IL

*ZAP is a phenomenal product at a very reasonable price. To think I was ready to settle for VT100 emulation for \$195!*

— Hank Streeter, Owner  
Integrated Software Development, Houston, TX

Requires an IBM PC or close compatible and 128K RAM.

## VT100, 102, TEK 4010/14 ... It's all Here

- Emulate TEKtronix 4010/14 and DEC VT 100, 102, 52 including variable rows and columns, windows, full graphics, more.
- Reliable file transfer to/from any mainframes and PCs including KERMIT and XMODEM protocols (plus a full copy of KERMIT). 50-38,400 BAUD transfer speeds.
- Download and fully automated logon with Macro and Installation files (scripts)
- EMACS, EDT and VI "Script" files are included. ZAP also supports products like DISPLA and SAS/GRAPH.
- Configurable to the communications and terminal features on the "other end": 1, 2 stop bits; 5, 6, 7, or 8 data bits; parity of odd, even, none, mark and space; remap most keys including the numeric pad. Set any screen size your hardware supports.
- DOS shell for full PC/MSDOS access.
- Supports 9 Comm ports and the IBM Monochrome, color, EGA, or Hercules Monochrome cards.

**Call 800-821-2492 to order ZAP risk-free for only \$95**

## DATA AND REPORTS+

"CA," took almost twice as long as the sort with record selection.

Data Edition and Reports+ score high marks for quality, consistency of design, and tutorial materials. Documentation is good, but lacking in technical detail of underlying program operations, interfaces, and file structures. File storage capabilities are weak in the area of data type choices and field capacity. Support for data verification is minimal, and program generation is required for all but the simplest data entry screen layouts. Report generation is the strongest feature of the combination; the basic Data Edition module supports definition of excellent column-oriented reports from single files, and the Reports+ module can generate superior report production programs that provide for multiple file access with little or no user code modifications.

Although the tutorial and training materials are excellent, a substantial investment in effort is required to learn the product. The overall system design of tasks and options requires the user to know what will happen before starting tasks and selecting options. This interface is professional, logical, and effective once learned, but the limited single file data management capabilities of Data Edition provide a meager return on the investment for the end user.

For the developer working in a BASIC language programming environment, the Reports+ module produces well-designed programs with excellent reporting capabilities, and the customizing procedures for tailoring generated programs are well documented and straightforward. The lack of provision for developing programs to read PDS data files except when PDS is loaded restricts the market for custom development. A runtime module that could be used to produce reports from PDS files would be a useful addition. The restriction that prevents generated Reports+ programs from running in an interpretive environment except on IBM computers makes the system unsuitable for users with compatible equipment using MS-BASICA who will need to develop reports from multiple files. In the appropriate environment, however, the combination of the Data Edition and Reports+ modules of the PDS system could be an excellent choice.

# Pixel Alignment of EGA Fonts

*By using the EGA's graphics data controllers, programmers can display character strings both horizontally and vertically on the screen.*

The standard BIOS of the IBM Enhanced Graphics Adapter (EGA) provides only limited character painting in high-resolution graphics modes. Characters or strings must be positioned on the screen at even byte boundaries and only in the horizontal direction. To many programmers, this does not create an inconvenience because the high resolution of the screen renders the byte alignment inapparent. However, the ability to align character strings precisely to any pixel improves the appearance of graphics and allows programmers to animate smooth string movement across the screen.

To address these limitations of the EGA BIOS, a pair of assembly language subprograms (listing 1: EGAFONT.ASM and listing 2: STRINGER.PAS) use the EGA's graphics data controller (GDC) to place horizontal or vertical character strings at any pixel position on the screen using font information from the EGA ROM BIOS. (For a discussion of the EGA's functional anatomy, see "The EGA Standard," John T. Cockerham, October 1986, p. 49.)

## THE GDC

The EGA actually contains two GDCs. Neither one is used in text modes, but in graphics modes each controls two of the EGA's four planes of graphics memory. The flow of data within the GDC is depicted in figure 1. The formats of the registers that control the GDC are listed in figure 2. Many of the EGA's registers perform multiple functions by accepting an *index register* that selects one of several internal registers residing at a single I/O address. The notation "3CF.2H" means that an index value of 2 is within EGA register 3CFH.

The GDC control of the two EGA bit planes is transparent to the programmer. Each bit plane has a latch that is filled when the system's CPU fetches a byte value from the video RAM. Although all four latches are filled on

ILLUSTRATION • MACIEK ALBRECHT

each CPU read, only the currently selected bit plane places its data onto the system data bus. During CPU writes, the latches are bypassed, and all of the bit planes receive the same data byte from the CPU's data bus. If one or more bit planes are *not* to receive that data, those planes must be explicitly disabled prior to the CPU write operation.

An 8-bit wide arithmetic logical unit (ALU) in the GDC manipulates data being routed toward the bit planes. The ALU can perform four logical operations—AND, OR, XOR, and MOVE—on its two operands, the data in the bit plane latches and the data from the CPU bus. MOVE simply copies bits verbatim from the CPU data operand.

The GDC mode register at 3CF.5H defines three writing modes for sending data into the bit planes, but only one of those modes, writing mode 0, is used in the code examples presented here. In writing mode 0, one of the ALU's inputs is always the data from the bit plane latches; the other input, however, may be selected from either the CPU data or data from the set/reset value register (3CF.0H). The set/reset enable register (3CF.1H) dictates the selection.

Bits 0-3 of both the set/reset enable and set/reset value registers map to EGA bit planes 0-3, respectively. A 1 bit

in set/reset enable for a given bit plane takes input from the set/reset value register. A 0 bit takes input for that plane from the CPU. If input is taken from the set/reset value register, the bit in that register associated with the bit plane in question is expanded to fill a byte, which is then passed to the ALU.

Once the inputs have been determined, the ALU combines them according to the preset operation code, one of AND, OR, XOR, or MOVE. This operation is determined by the value in bits 3 and 4 of the ALU operation register, 3CF.3H. The byte of data that results is rotated to the right, by the number of bits that is provided in bits 0-2 of the ALU operation register.

The ALU's work is then finished. Its output byte is passed on to the GDC mask operation, (figure 3). During the mask operation, the bits of the ALU result are written into the graphics RAM bit planes. Figure 3 shows all four bit planes in parallel and shows all eight rows of an 8-by-8 character for clarity. In operation, only one row is acted upon at a time, and eight separate iterations are required to write the entire character pattern into the bit planes. Keep in mind that only the top row in each set of figure 3's planes is taking part in the mask operation.

**FIGURE 1:** *The GDC on the EGA*

The set/reset enable register acts as a switch, selecting between CPU data and data originating in the set/reset value register. The selected data and the data from the EGA plane latches become the two inputs to the ALU for the set/reset operation in figure 3. When a shift count is specified, CPU data are shifted by a hardware shifter before being applied to the ALU.

In the mask operation, data from the ALU, which should be considered foreground data, is combined with data already in the bit planes, comprising the background. The GDC mask register (3CF.8H) determines whether a given bit in each byte of data written to the bit planes is to be foreground or background data. If a mask bit is 1, then the corresponding bit from the ALU is written into the video RAM as foreground

data. If the mask bit is 0, then the corresponding latch data bit, which originated in the bit plane, is written back to video RAM as background data.

The background data in the mask operation comes from the bit plane latches rather than the bit planes themselves; the latches are loaded only during a CPU read of the bit planes. If the background does not change, the latches do not need to be reloaded, but

if the background does change between writes, the latches must be reloaded by another CPU read of the bit planes.

The power of set/reset and the GDC mask of the EGA is not apparent when focusing on a single plane of the EGA. Together, the four parallel bit planes of the EGA determine the color ultimately displayed on the screen for each pixel. By placing in set/reset the desired color of the pixels, enabling the

**FIGURE 2:** Registers of the EGA's GDC

Each of the bits 0-3 in both the set/reset enable and the set/reset value registers is assigned to one of the four EGA planes. The other four bits are ignored.

set/reset operation for all bit planes, and setting the mask register to the byte value to paint, one CPU data write will paint up to eight pixels while keeping the background intact. This is precisely the technique that EGAFONT.ASM (listing 1) uses to paint in characters.

### EGA BIOS FONTS

When dealing with the display of graphics characters in a graphics mode, it is often helpful to distinguish between the extended ASCII character codes, which are numbers in the range 0-255, and the *glyphs*, or pixel patterns, which represent these characters on the screen. A given ASCII character, such as A, may correspond to several glyphs if the character may be painted in any of several different directions.

The EGA BIOS stores two fonts on the ROM chip. One is an 8-by-14 font, and the other is an 8-by-8 font that is identical to the font used in the CGA. Each glyph is 8 pixels wide. The size, or *points*, of the font is either 8 or 14. The BIOS function call with AH = 11H (character generator routine), AL = 30H (information), and BH = 2 or 3 returns the pointer in ES:BP to the 8-by-14 (BH = 2), or the 8-by-8 (BH = 3) font table. Each glyph is laid out as a series of bytes representing rows from the top to the bottom at ascending memory addresses. Each byte in the font is a bit map of one row of a glyph, with one bit per pixel. Accessing an individual glyph in the font table is performed by multiplying the character's ASCII code by the font's point size. The resultant offset

is added to the pointer value returned by the BIOS function call.

When the user calls **EGASInitFont**, the information returned from the BIOS is stored into an array of font records. Each font record keeps the width and points of one font and a pointer to the start of the font.

### HORIZONTAL PAINTING

Painting a horizontal character into EGA RAM is a straightforward procedure. Figure 4 illustrates the sequence of operations. EGAFONT.ASM calculates the byte address in the display RAM where the glyph is to be placed from the X Y parameters supplied by the caller. The offset of the leftmost pixel of the glyph within the byte is given by the low 3 bits of the X coordinate. This offset specifies the number of bits by which the byte must be rotated to the right to align the left hand edge of the glyph with the byte boundary. In addition, the offset is used to index into the mask table to select the mask for isolating the left and right portions of the rotated glyph. Special techniques are required to use the mask tables from Turbo Pascal external machine code; these are explained below.

The actual horizontal painting of each byte of the glyph is performed by the subroutine **fbhor** within EGAFONT. Writing a glyph to screen memory as done by EGAFONT is a transparent operation in that the background is not changed. Each glyph is painted to the screen by way of a loop that calls **fbhor** once for each pixel row of the font in

## Can a small company with some exciting solutions for micro-mainframe communications take on a giant corporation like IBM and win?

Of course not. We'd be crazy to even try. IBM® is the standard. And it's becoming more so every day. That's why our powerful 3270-PC® Emulator is true blue. And that's why our emulator is the only system available that is compatible with IBM's 3278/79® Emulation Adapter.

Attachmate is IBM compatible and we plan to stay that way. But compatibility doesn't mean that we can't improve on a good idea. That's why our emulator does a few things that the industry standard doesn't do.

Our 3-N-1™ Adapter is IBM and IRMA® compatible. It also gives you multiple sessions, windows, file transfer, graphics and IBM-standard API. And with Attachmate, you can mix coax, remote SDLC, and LAN workstations in the same network and make it work.

There are some other things that we do to give you more than IBM. You can find them out by asking for our free *Quick Reference Guide for Micro-Mainframe Communications*—complete with a chart comparing IBM, IRMA, and Attachmate.

**1-800-426-6283**

# Attachmate

*Micro-Mainframe Technology:  
We put our heart in it!*

Attachmate Corporation  
3241 118th S.E.

**FIGURE 3:** *The GDC Mask Operation*

Glyph background information resides in the plane latches. The glyph is described in the GDC mask, which is the same for all four EGA planes. Foreground color information is applied through the set/reset value register in this example. Foreground color also could be applied as CPU data on a plane-by-plane basis by altering the bit values in the set/reset enable register. Only one glyph row is written to the planes in a single set/reset operation; the entire glyph is painted with a loop.

# Soft \*Rite >> LANbasic!

Soft \*Rite announces a *Superior* three-part programmer's tool.  
 Microsoft BASIC™ compatible in every place that counts. \*

LANscreen	LANbasic	LANdbase
<p>LANscreen makes the burden of defining your database record structures one that you will look forward to instead of dread. Standard fields and types such as "Money", "Telephone" and "Date" are one keystroke to generate. As many as 255 database structures can be related to a single screen! Segmented data input can be done automatically by editing the field display. Part numbers with spaces or dashes and slashes are automatically parsed down to the essential raw data. Definable Upper and Lower limits for numeric inputs along with ACCEPT/EXCEPT input filters are standard features. Screen Mask generation is done with a "freestroke" approach. You may put mask elements and data input/output cells wherever you wish. COLOR them too! EGA support too!</p> <p>*Drivers Installed for IBM PC-NET/MS-NET</p>	<p>LANbasic is your own personal solution to powerful data manipulation. How many times have you got excited over some new "total" database package only to find out (after spending a fair amount of time and money) that you were stuck in some corner, unable to do some function that has become standard in "In Business for Money's" Basic? The manual is 400 pages long, so we cannot fully describe all the features, but here are a few in ADDITION to the ones you are now used to:</p> <p>★ COMDATAS 14 common areas ALWAYS available to inside or outside, chained or linked programs ★ Re-assignable printer ports LPT1-LPT4 ★ Generic filename use that allows file and database locations to be re-defined outside of basic in a user-created REDIRECTOR file, to ease multi-user system configuration ★ USESCREEN, &lt;1-16&gt; ★ SCREENINPUT, &lt;anyfield&gt; ★ SCREENOUT-PUT, &lt;anyfield&gt; ★ OPENDB, &lt;remote or local database manager&gt; ★ DBGET, &lt;variable from DBM, automatically defines and dimensions in LAN basic&gt; ★ DBPUT, &lt;same&gt;</p>	<p>LANdbase is the home for your data. LANbasic calls are coupled to LANdbase via network communications (PCnet or ?). A single keyvalue and function number will return a record. Multiuser record locking is handled by simply putting an 'X' after the read call. (i.e. RDDBEQUX, &lt;argument&gt;). Automatic "health checking" to warn you of poor hardware performance and lost or fragmented data. "Paranoid" mode of operation where files not accessed for some time will be closed and reopened to flush buffers and insure integrity. Password, Userlevel and Data encryption functions. Several DBM's can be installed in the network system to improve performance and reliability. Toggle mode screen (printer) reporting to record log-on or other access activities. Bill Fairman's tried and proven true C-Tree(c) data management product.</p>

CIRCLE NO. 186 ON READER SERVICE CARD

**FIGURE 4:** Pixel-aligning a Character Glyph

If a glyph must be painted across byte boundaries, it must be shifted so that its left edge aligns with the boundary. The two portions of the glyph must then be separated in a masking operation and written separately to the EGA planes. This shifting is done by the CPU, *not* by the EGA's hardware shifter.

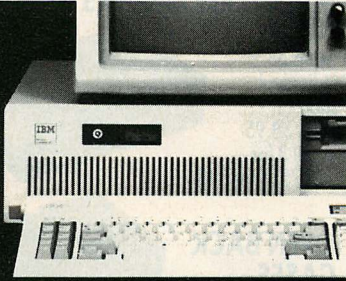

use, up to the font point size. Rows of font data are passed to **fbhor** in DX. **Fbhor** rotates the font data byte to the right by the same number of bits as the pixel position of the glyph is offset from an even byte boundary.

After rotation, the glyph row is divided into two sections that must be written separately into adjacent bytes in EGA RAM. The left portion is isolated by a logical AND with a value chosen from the in-line table **mask1** with the pixel offset acting as array index.

The isolated left portion is then placed into the GDC's mask register, and the color value is placed into the set/reset value register. Next the CPU reads in the destination byte of the left portion of the glyph, loading the GDC latches with the background graphics data. Finally, in a single operation, the CPU performs a write operation to RAM, and the GDC paints the left portion of the glyph row (see figure 3). **Fbhor** increments the destination address and repeats the operation for the right portion of the glyph row before returning to the main string painting loop that updates the destination address to reflect the next scan line where the next glyph row is to be placed. This process is repeated for the number of rows in the

## Nothing Should Come Between Mainframe Mag Tapes and Your dBASE or Lotus Except

## Telebyte Tape Drives

**TDX Mag 9-track 1/2" Tape Systems** from Telebyte provide faster, error-free downloading of mainframe data into your PC. You control the start-stop tape drive either from the keyboard or with Telebyte's exclusive **Dataverter** software for faster file transfer — the equivalent of a 720,000 bit/second datalink.

Telebyte TDX tape drives are available at either 45 or 75 ips, feature dual density (800/1600 bpi) storage and back up processed files at 2 MB/minute (up to 10 times faster than other 9-track drive systems) as a bonus.

Enter data into **dBASE®** and **Lotus®** with **no user programming**. You do it in two easy steps because Telebyte's exclusive **Dataverter** runs **under both DOS 2.0 and Xenix™**. **Dataverter** will automatically convert packed, zoned and unsigned decimal field files, as well as labeled tapes, from EBCDIC to ASCII. The tape system is also supported by software languages in your PC, including C, BASIC, Fortran, Cobol, etc.

Only Telebyte offers such mainframe standards of reliability and IBM-compatible tape drive quality for so little money.

## PROGRAMMING PRACTICES

**FIGURE 5:** *Painting Vertical Characters*

Glyphs to be written vertically must be rotated by the CPU and then painted to the screen by the same process shown in figure 4. Byte-aligned glyphs may be painted to the screen in one operation, as shown in the lower rotation.

font, until the entire glyph has been painted to the screen.

### VERTICAL PAINTING

Because the EGA fonts are organized as a series of horizontal lines, no shortcuts are apparent for painting a glyph described by a horizontal font into a vertical box. When writing vertically, EGAFont must set the pixels individually for each row of the font, transforming the pixels from a horizontal to a vertical orientation as it goes. This transformation is shown in figure 5. The routine that paints font information to the screen is **fbvert**.

When painting in a horizontal direction, the parameters *X* and *Y* specify the upper left corner of the first glyph in the painted string. Painting vertically in an upward or downward direction raises the question of which corner of the glyph is being specified by *X* and *Y*. EGAFont follows the rule that *X* and *Y* specify the upper left corner of the first glyph, *from its own vantage point*. Hence, writing vertically in a downward

direction makes *X* and *Y* specify the upper *right* corner of the vertical rectangle occupied by the written string, although the upper right corner of the rectangle is the upper *left* corner of the first glyph in a vertically written string. Note the marked positions of *X* and *Y* for the rotated glyphs in figure 5.

**Fbvert** paints vertical glyphs in both directions. The difference in operation between the two directions lies only in whether the address pointers are incremented or decremented. When drawing a glyph down the screen, each succeeding horizontal pixel is one scan line lower on the screen, at an increasing line address. When painting up the screen, each succeeding pixel is written at a decreasing line address. Similarly, the writing direction also dictates whether the pixel offset is incremented or decremented for each subsequent row of the glyph. When painting vertical glyphs in a downward direction, each row of the glyph is painted to the left of the previous row, at a lower pixel offset. When painting vertically in an

upward direction, successive rows are placed to the right of previous rows at higher pixel offsets.

## THE PROGRAMS

STRINGER.PAS (listing 2) is a Turbo Pascal program that demonstrates the calling syntax for the routines in EGAFONT.ASM (listing 1). Calling the routines in EGAFONT from Turbo Pascal presents some special challenges. Turbo Pascal loads external machine code subprograms into the code segment wherever they happen to fall within the code generated from the larger Pascal program. Therefore, the external subprogram never knows its own location. This is not a problem from a code standpoint, because well-behaved 8086 machine code is fully relocatable. However, if in-line tables are assembled into an external subprogram for its use, the subprogram has no direct means of addressing the in-line tables.

The trick employed by EGAFONT to locate its own tables requires some explanation. Near the beginning of the executable code in EGAFONT is a dummy procedure, `dot2`, that contains no code. It exists only to provide a destination for a near (16-bit) CALL opcode. After the caller's DS and BP values are

pushed onto the stack, a CALL is made to dummy procedure `dot2`. Because `dot2` immediately follows the CALL opcode, no significant change occurs in the order that instructions are executed. In executing the CALL, the CPU pushes the return address onto the stack. This address, which is a 16-bit offset into the code segment, corresponds to the label `dot3` and is immediately popped off the stack into AX. By subtracting the assembler-generated value of the label `dot3` (which is the offset of `dot3` from the first byte of generated code in the external subprogram) from the CPU-determined offset of `dot3` into the code segment, the offset of the first byte of the subprogram into the code segment is generated and stored on the stack in variable `csx`. By adding this value to the assembler-generated offset of the in-line tables, the true address of the tables can be generated at runtime.

Font information is maintained in a font table in the Pascal data area rather than within the machine code subprograms. The structure of the font descriptions contained in the font table is defined both in EGAFONT beginning at label `fontptr` and in STRINGER as the record type `fontrecord`. The font records themselves must be filled with

the necessary font information before they are used. **EGAnitFont** accomplishes the initialization of font records.

**EGAStrng** must be passed a font, the starting location of the upper left hand corner of the first glyph (from its own perspective, as explained above), the direction in which the string is to be written, the desired color, and the operation to be performed with the pixel data. The ordering and types of these parameters is documented in the listing of STRINGER.PAS.

STRINGER.PAS as given operates in EGA mode 16, 640 by 350 color. Users who wish to run on the EGA's 640-by-350 monochrome mode need only change the `m` parameter to the procedure `SetMode` to 15.

Understanding the operation of the EGA's Graphics Data Controller is not necessary to use the software presented here. However, the EGA is a classic example of knowledge equating to power; the more programmers understand the labyrinthine facets of the EGA, the better they will be equipped to tap its considerable abilities.

# FORTRAN PROGRAMMERS

Looking for the right PC FORTRAN language system? If you're serious about your FORTRAN programming then you should be using F77L - LAHEY FORTRAN.

*"Lahey's F77L FORTRAN is the compiler of choice. It's definitely a 'Programmers FORTRAN,' with features to aid both the casual and the professional programmer. . . F77L compiled the five files in a total of 12 minutes, which was 4 times as fast as MS FORTRAN and an astounding 6 times as fast as Pro FORTRAN." - PC Magazine*

Compare the features and performance of other PC FORTRANs with F77L and you will find that F77L is clearly the superior product.

- Full Fortran 77 Standard (F77L is not a subset)
- Popular Extensions for easy porting of mini and mainframe applications
- COMPLEX\*16, LOGICAL\*1 and INTEGER\*2
- Recursion - allocates local variables on the stack
- IEEE - Standard Floating Point
- Long variable names - 31 characters
- IMPLICIT NONE
- Fast Compile - Increases productivity
- Source On Line Debugger (Advanced features without recompiling)
- Arrays and Commons greater than 64K
- Clear and Precise English Diagnostics
- Compatibility with Popular 3rd Party Software (i.e. Lattice C)
- Easy to use manual
- Technical Support from LCS

• NEW FEATURE - NAMELIST

## F77L - THE PROGRAMMER'S FORTRAN

\$477.00 U.S.

System Requirements: MS-DOS or PC-DOS, 256K, math coprocessor (8087/80287)

# Introducing multi-channel communications boards 400% faster than what you're probably using now.

Introducing the DIGIBOARD COM/Xi Series front-end processor. Intelligent multi-channel communications boards 400% faster than the industry standard.

Like our popular COM/X Series, they provide users of PC/XT/AT-compatible computers with four or eight individually addressable serial ports. But with the new COM/Xi series we've added:

- an 80188 co-processor operating at 10 MHz
- 256K of dual-ported RAM + 16K of ROM, all accessible to user/ programmers for application and security software development
- a modular design that allows us to custom-tailor I/O to individual customer requirements.

On-board intelligence means more speed for multi-user operating systems and multi-channel data collection and dissemination.

And makes the new DIGIBOARD COM/Xi Series a more intelligent choice for you.

**DigiBoard**  
Plugging you into Tomorrow.

# TASKVIEW™

## WHY GIVE UP...

BATCH FILES,

I/O REDIRECTION

SIDEKICK™

DOS MENU PROGRAMS,

MOST OF YOUR RAM,

EXECUTION SPEED?

### Compatible, efficient DOS multi-tasking.

We designed Taskview with efficiency in mind. During normal operation, TASKVIEW hides behind DOS, providing you with control of up to 10 concurrent or non-concurrent programs. Just the touch of a key instantly switches a program to the foreground. Included desktop utilities let you cut and paste from program to program. Simple to use and reasonably priced, no well equipped PC user should be without it.

Requires: PC/AT/Jr compatible, DOS 2.0-3.1, 256K RAM, 1 Floppy drive.

## REMEMBER WHO DID IT FIRST!

### PERSTOR Double Capacity Controllers

The PERSTOR 200 Series controllers double or triple the factory rated storage capacity of any attached Winchester hard disk drive — fixed or removable!\*

Replace the hard disk controller in your IBM PC or XT with the PERSTOR 200 Series controller, or add the PERSTOR 200 Series controller to an AT. Reformat the drive, and you'll double the factory rated storage capacity. Utilize our DOS compaction software that comes standard, and the capacity can be even greater. In addition, the cache access method incorporated in our software allows you to reduce average access time by 50% or more. Just think of the increased productivity you'll get!

Systems and Software, Inc. also offers a full line of PERSTOR 200 Series hard disk systems. A PERSTOR system incorporates standard fixed and/or removable ST506/412 Winchester drives and our one of a kind controller to offer you the highest quality internal or external subsystems. The PERSTOR line also offers Xenix and Unix compatibility, and direct attachment of the PERSTOR drives to the AT controller.

\*PERSTOR Approved Drives  
Note: PC and AT refer to IBM models and compatibles. All capacities mentioned are data dependent. IBM PC, XT, and AT are registered trademarks of IBM Corp.

# PC MAGAZINE LEADS YOU OUT OF THE INFORMATION JUNGLE...

Exploring the PC market is a confusing, and often risky, endeavor.

Lose your way, and you lose valuable time. One wrong turn, and you can lose lots of money.

That's why IBM and compatible PC users look to *PC Magazine*. *PC Magazine* eliminates the risk in purchasing decisions with comparative reviews and product evaluations from the PC Labs, where products are tested the way you use them every day. It's the pathfinder to products that meet your specific needs—and those of others in your company.

*PC Magazine* puts you on the trail to new applications with power tips and special reports that will help you make the most of your system.

*PC Magazine* goes one step beyond leading you through the microcomputing jungle. *PC Magazine* leads you *out* of the jungle to the PC environment that meets your daily demands.

## GENERIC CADD

*Generic Software, Inc.*  
8763 148th Avenue NE  
Redmond, WA 98052  
800/228-6301

PRICE: \$99.95

CIRCLE 358 ON READER SERVICE CARD

Generic Software's Generic CADD package brings the low-budget CAD user the functionality of much more expensive systems for under \$100. The term CADD (computer-aided drafting and design) may not be entirely deserved, but the price belies the power of the program.

Generic CADD resembles early versions of AutoDesk's AutoCAD. The screen layout is very similar, with coordinates displayed on the top line, a screen menu along the right edge of the screen, and three lines of text at the bottom. Commands can be selected from the screen menu or typed in at the command prompt independently of the current screen menu. Lines can be drawn at the command prompt without entering an explicit command.

Commands are entered quickly with two-letter names. The two-letter names, however, are not very descriptive in many cases. Whereas LI is a straightforward abbreviation for the Straight Line command, YG is a rather

esoteric abbreviation for Layer Change. The new user is well-advised to keep the supplied reference card handy while learning the commands.

The program provides a complete set of drawing primitives: points, lines, circles, arcs, text, rectangles, ellipses, regular polygons, and complex curves. Generic CADD also provides a facility for the creation and use of complex objects (or symbols) called *components*, which are constructed of primitives and/or other components. Objects can be assigned line-type and color properties individually, and even can be classified by layers. Generic CADD provides 255 numbered layers.

The set of editing commands is complete. Objects can be erased, moved, copied, or broken. An Object Change command can change the color and line type of an object. Objects can be selected for editing by choosing them through a window or layer.

Generic CADD's drawing world is limited in size. Experimentation revealed that the drawing world is limited in height to approximately 360,000 inches—where one database unit represents one inch. (The manual does not include those statistics.) The display shows the cursor position only to four decimal places, but the cursor moves smoothly between any point on the screen at any scale. This is a disadvantage because accurate placement between the grid snap points cannot be ensured. When the system is set up with the Hercules Graphics Card installed, setting the limits to a large value and moving the cursor past that point sends the program into outer space. The system dumps the user out of the program into DOS, and then the system has to be rebooted. With the IBM Color Graphics Adapter (CGA) installed, this problem does not occur.

Display controls and drawing aids are complete, including zoom, pan, redraw, snap to grid and to nearest point,

grid, reference point and construction point display control, and layer. Units can be displayed in both metric and English units, including feet and inches, with inches present in either decimal or fractional form. Angles are shown in decimal degrees or in DD:MM:SS format. The rubber-band cursor can be toggled on and off.

Components, layers, and entire drawings can be saved and loaded, even into specified layers, if desired. Generic CADD can dump all the symbols of a drawing, placing each component into a separate file. This would be a welcome feature in many of the more expensive programs. Generic CADD also can dump an entire drawing into a batch file, creating a command script for the entire drawing that can be edited or reexecuted as a demonstration.

Hardware requirements are modest compared with more expensive CAD programs. The host must be an IBM PC, PC/XT, PC/AT, or compatible with 384KB of RAM; two diskette drives (or one diskette and one hard disk); and a supported graphics adapter and monitor combination. Optional items include an 8087 or 80287 numeric coprocessor, a plotter, and a digitizer or mouse. The program supports a variety of devices, and includes a menu-driven program for easy configuration. Supported devices range from basic items such as the CGA and the Mouse Systems PC Mouse, to such high-performance items as the Number Nine Revolution graphics controller and E-size plotters.

The documentation is complete and well organized in that it follows the standard screen menu. The manual includes a convenient reference card.

Generic CADD can be customized to a surprising degree. Screen menus are separate ASCII text files, allowing the user to modify the standard menu or to create an entirely new menu. If a digitizer is used as the pointing device, it can be configured to include up to 10

digitizer menu areas as well as the screen pointing area. Screen and digitizer menu items can contain single commands or complex command sequences. Menu items are limited to 80 characters, and menu files to 5KB. Command sequences longer than 80 characters can be created in batch files and loaded via screen or digitizer menu selections. Both menu items and batch files are limited to linear sequences of normal commands; programming constructs are not provided.

Generic CADD can also be customized with the creation of additional text fonts. New fonts are created graphically, and existing fonts can be edited.

Conspicuous by their absence, in an otherwise full-featured program, are automatic dimensioning and hatching facilities. Measuring commands are included—for distance, angles, and area—but extension lines, arrowheads, and dimension lines must be drawn piece-meal, or with a custom macro. Likewise, cross-hatching must be performed one object at a time. These features are offered in an add-on module called Auto-Dimensioning, which sells for \$49.95.

One anomaly of Generic CADD is that the screen cursor and menu cursor are always on, and they track vertically. Setting the snap-to-grid on can cause the menu cursor to skip some selections if they are aligned precisely midway between two grid points. The Window Erase command is erratic; it often refuses to erase an entire screen, but the command functions properly when the window is reduced in size.

Another quirk of Generic CADD is its zoom feature. The available zoom ratio of 4-million-to-1 is nice, but the increments possible are very limited. For example, the user cannot zoom in at 80 percent. The zoom-in window must be smaller than 75 percent of the screen. Zooming out has a similar problem in that the minimum zoom out is often too much to be of use.

Using Generic CADD on the CGA is unacceptable. The text display is very coarse. It is not possible to hit all of the menu selections and the prompt line is not completely visible.

When compared with other inexpensive CAD packages, Generic CADD fares well and is worth its modest price. Although it lacks some drafting features found in more expensive programs, it is equal to most drafting requirements for the CAD student, and even includes some features missing in more expensive programs.

—VICTOR E. WRIGHT

### FANSI-CONSOLE

*Hersey Micro Consulting, Inc.*  
P.O. Box 8276  
Ann Arbor, MI 48107  
313/994-3259

PRICE: \$75 (demo disk, \$25)

**F**ANSI-CONSOLE is an installable console-driver device that works with DOS 2.0 and later and runs on IBM and compatible systems. It replaces the DOS console driver as well as the screen and keyboard parts of the ROM BIOS.

Like the ANSI.SYS driver included with DOS, FANSI-CONSOLE processes ANSI X3.64 control sequences. FANSI-CONSOLE, unlike ANSI.SYS, supports a much larger subset of the standard ANSI escape sequences. Also, the product includes extensions to the standard as implemented in VT-100 terminals.

This product can speed up all screen I/O performed through DOS or BIOS calls. For example, a 520KB text file was copied to CON:. The test was run on a 4.77-MHz IBM PC, with the test file residing on a 20MB hard disk with an average access time of 85 milliseconds (ms). Without the console driver, the file took 5 minutes, 30 seconds to be displayed. After rebooting with FANSI-CONSOLE, displaying the file took 2 minutes and 48 seconds—about half the time. Similar time savings occur when running programs that do not write directly to screen memory.

The Scroll Lock key also will behave differently. Pressing it will halt the display and put the user into screen recall mode. The arrow keys then can be used to scroll through the saved screen buffer. Saved-screen information also may be written to a file. Pressing Scroll Lock again continues the previous display where it left off.

FANSI-CONSOLE increases the keyboard type-ahead buffer to 255 characters, and it also can decrease the key-re-

peat delay as well as increase the key-repeat rate. It offers flicker-free scrolling for many color monitors and allows the user to rearrange key definitions (including a predefined key-definition file for the Dvorak layout) and to use "sticky" Shift keys for one-finger typing. Also, the user can control the length of the sound triggered by the ASCII BEL control character and also can add an adjustable keyboard click.

FANSI-CONSOLE's memory requirements depend on which features are specified. The driver is loaded via a line in the CONFIG.SYS file:

**DEVICE=FANSICON.DEV**

Optional parameters can specify the features to enable and provide some control over memory usage. The screen-scroll recall buffer can be configured to use expanded memory, if available, instead of DOS memory.

FANSI-CONSOLE can be configured in two ways. Options are set at load-time by adding the appropriate commands to the DEVICE= line in CONFIG.SYS. Options can be changed after loading by typing a file containing the appropriate escape sequences to the console for interception by the resident driver. In the most recent release, a menu-driven DOS transient program is provided that enables the user to select commands from menus. The program then transmits the appropriate escape sequences to the console.

FANSI-CONSOLE can process significantly more control sequences than ANSI.SYS, which allows greater control over the screen displays. A 23KB demo file (included on the disk) provides a dazzling, on-screen display when it is typed to the screen. The file contains more than 700 lines of escape sequences and performs several tricks, including rapid horizontal and vertical scrolling within windows.

Although FANSI-CONSOLE's documentation is nicely laid out and well written, some of the explanations of the features are severely lacking—additional examples would be helpful. A list of programs and systems that are known to be compatible is provided as well as a much shorter list of those that are incompatible with FANSI-CONSOLE. The list of incompatible computers include: PCjr, 3270-PC, DEC Rainbow, Tandy 2000, TI Professional, and Wang PC.

The increased display speed, faster keyboard repeat rate, and full ANSI.SYS compatibility make FANSI-CONSOLE a fine enhancement to any IBM system.

—JOHN WALKENBACH

## ABOVE DISC

Tele-Ware West

18023 Skypark Circle, Suite E-2

Irvine, CA 92714

714/250-3320

PRICE: \$69.95

CIRCLE 360 ON READER SERVICE CARD

For those who want the benefits of expanded memory without the expense of a board, Tele-Ware West produces a software product that simulates the nonreserved functions of expanded memory on a disk system or in extended memory of the IBM PC/AT. Above Disc, which conforms to the Lotus/Intel/Microsoft expanded memory specification (LIM EMS), provides access to 8MB of simulated, paged memory by implementing virtual storage.

The LIM EMS does not define hardware requirements, nor does it define how expanded memory is to be implemented. It is a software interface, just as DOS is a software interface to application programs. An application treats expanded memory in the same way it treats a file; it is a logical entity. Exactly where it exists and how it operates is of no concern to applications.

Hardware vendors typically place their 64KB page frame on some 16KB boundary. The reason for this is purely economical: it requires less address decoding circuitry. The LIM EMS says nothing about placement of the page frame; it merely defines its existence. The exact location of this frame may be known by asking the EMS driver (function 2), which returns the segment address of the paragraph boundary.

Theoretically, the page frame could be placed on any 16-byte (paragraph) boundary. This is precisely how Above Disc operates. Once it is made resident, Above Disc occupies 64KB for the page frame, plus a small amount for the expanded memory driver.

Above Disc's INSTALL program guides the user through installation by asking (1) Which is the boot drive?, (2) Which drive is to contain the swap file?, (3) How many 16KB pages are to be allocated to expanded memory?, and (4) Do you wish to update CONFIG.SYS?

Above Disc is implemented in two parts: a resident device driver, named VEM.SYS, and a resident file, named ABVDISC.COM. INSTALL copies both of these files to the boot volume and updates the CONFIG.SYS file to include VEM.SYS. The file ABVDISC.COM is used to initiate expanded memory.

Above Disc cannot support device drivers that use expanded memory. As a device driver is being initialized, it is permitted to use only DOS services for character I/O (functions 01H through 0CH). This implies that file access is not allowed, and, of course, Above Disc relies heavily on DOS files. Therefore, programs such as Quadram Corporation's XQLPT1.SYS (a printer spooler that uses expanded memory as the storage medium) cannot function.

The following benchmark tests were conducted on an AT Model 239 with 640KB of conventional memory, 1,920KB of extended memory (using American Micronics' Elephant board), 1,024KB of Intel's Above Board expanded memory, and a 30MB hard disk with a 37-millisecond (ms) average access time. In both modes, Above Disc was instructed to simulate 1,024KB of expanded memory. All tests were conducted with available versions of commercial software. All program and data files were kept on the same hard disk that contained the SWAP file.

Two tests were conducted with Lotus 1-2-3 version 2.0. Test A (see table 1) consisted of loading and calculating a spreadsheet that contained the integers 1 to 4 in cells A1..D1 and the formula 1+A1, 1+B1, etc., in cells A2..D2, continuing to cell D4999, which contained the formula 1+D4998.

Test B (see table 1) had in cells A1..A5000 the text string "This is a long line of text which will be moved and copied," and consisted of loading and then copying A1..A5000 to H1..H5000.

An additional test was conducted with DESQview version 1.21 from Quarterdeck Office Systems (see table 1), which consisted of loading five copies of BASICA into the system and measuring the amount of time required to SWAP IN a BASICA window.

Two final tests were conducted with Ready! version 1.0 from Living Videotext, Inc. Test 1 (see table 1) measured the time it took to load the program, and Test 2 (see table 1) measured the time to invoke it. While the time to invoke Ready! from Above Board memory was essentially nil; it did not take much longer to invoke the program from extended memory. The results were averaged over several trials, but, because a stopwatch was used, the results are approximate.

With the implementation of disk paging, Tele-Ware has actually created a true virtual storage mechanism. The concept of virtual memory is not new; however, its implementation on personal computers is. Virtual storage is a trade-off of performance loss for hardware dollars saved.

—GUY QUEDENS

**TABLE 1: Timed Benchmark Test Comparisons**

	ABOVE BOARD	ABOVE DISC with AT extended memory	ABOVE DISC using a disk file
<b>Lotus 1-2-3</b>			
Test A			
Load	152.8	167.3 (1.1)	325.3 (2.1)
Calculate	28.6	29.1 (1.0)	38.1 (1.3)
Test B			
Load	25.1	26.7 (1.1)	42.9 (1.7)
Copy	8.1	16.1 (2.0)	113.0 (14.0)
DESQView	0.8	1.2 (1.5)	6.0 (2.2)
Ready!			
Test 1	12.5	14.3 (1.1)	18.8 (1.5)
Test 2	0.6	0.8 (1.3)	3.9 (6.5)

All times in seconds.

Numbers in parentheses represent the performance factor relative to the Above Board.

Using a disk file as expanded memory with Above Disc allows economical, if infrequent, use of very large databases without incurring any hardware expense.

# Borland sells Turbo Prolog<sup>TM</sup> for \$99.95

## Arity will give you \$200 for it!

### During our Salute to Borland Special.

#### They sure know how to market

We're the first to admit it — those folks at Borland are geniuses at marketing. With Turbo Prolog, a neat little product, Borland has done more to further the use of Prolog in the U.S. than anyone else — and we sincerely thank them.

In fact, we're so happy about what Borland has done for Prolog that we've decided to celebrate. And as long as we're thanking Borland, we thought we should thank all you new Prolog users out there, too. So until January 31, 1987, we're offering a \$200 trade-in credit when you trade up from Turbo Prolog to the Arity/Prolog Compiler and Interpreter or the Arity/Prolog Combo Pack.

#### Software that roars

#### We sure make a great Prolog

You might think it strange that we're grateful to Borland, but Turbo Prolog has been great for our business. It has introduced thousands of people to Prolog, just as Arity/Prolog has shown thousands of users the power and flexibility a true Prolog can provide. That's why so many people have traded up — to take advantage of our one gigabyte of memory, true Prolog implementation, and complete development environment for building real applications.

#### You sure have a great opportunity

We want to make sure you all have the chance to trade up. If you think your Turbo Prolog is good but you're ready for something great, take advantage of our "Salute to Borland Special." Simply send in page 213 of your Turbo Prolog manual with your order — and save \$200 on the best PC-based Prolog available.

And those of you who haven't bought Turbo Prolog yet, give us a call. Find out how we'll include you in our celebration, too.

Dial 1-800-PC ARITY

# Free Enterprise

*User-supported software may be an alternate route to take a program to market, but heed the warning signs along the way.*

Writing a commercial computer program takes significant time and effort; making a copy of a program takes very little of either. Marketing software through traditional channels is expensive. Hence the development of the marketing technique known variously as user-supported software, shareware, or Freeware. (Freeware is a term coined by the late Andrew Fluegelman to market programs, such as his PC-TALK, and is a trademark name. Shareware is a term used extensively by Nelson Ford in conjunction with his software-clearinghouse network in Texas. To avoid any unintended confusion or implication, the term user-supported software will be used throughout this article.)

The author of user-supported software encourages its copying and distribution at a nominal (or no) cost. Users are requested to contribute what they think is fair to the author, but are under no legal obligation to do so. A small, unscientific survey indicated that significant financial rewards from the distribution of user-supported software are not very likely, although there are several notable exceptions, such as PC-TALK and Jim Button's PC-FILE.

In the spirit of those who choose to give away their software, here are some ideas about how to do so. These ideas are general; bear in mind that the marketing of games, for example, is different from the marketing of financial-planning software.

The distribution of user-supported software should be approached in the same fashion as the distribution of software through traditional commercial channels—attention should be paid to trademark, copyright, trade secret, patent, and liability issues. The decisions on these issues should be tempered, however, by the fact that the program is being distributed without charge.

The trademark issue involves two questions: should a trademark be claimed and, if so, should it be regis-

ILLUSTRATION • MACIEK ALBRECHT

tered. Fortunately, significant trademark protection is available for free. Simply placing the letters *TM* after the product name can establish that name as a trademark. For example, if you have a spreadsheet program called Pond Scum, your first screen should display "Pond Scum (TM) Spreadsheet Program." This establishes your claim to the trademark Pond Scum and protects you against subsequent users of the same, or a confusingly similar, mark on similar products in the geographic area in which your mark has been used commercially.

A federally registered trademark confers substantially greater protection, but the filing fee is \$165, and the mark cannot be registered until it has been used in interstate commerce (for example, by a sale to someone in another state). The owner of a federally registered trademark is protected against subsequent users of the same, or a similar, mark anywhere in the United States. A trademark can be claimed by using the *TM* symbol and then registered after its commercial value is determined. There is no time limit within which a mark must be registered, but the longer you wait, the greater the chance someone else will acquire adverse rights. (Some states have an inexpensive state registration procedure that can be followed as well.)

The copyright issue also involves two questions: should the program be copyrighted and, if so, should it be registered. Under the U.S. Copyright Act, a program is automatically copyrighted as soon as it is expressed in a tangible medium, such as a source code listing or a program saved on a disk. The question really is whether or not to abandon the copyright by placing the program in the public domain. It is possible to allow certain broad public uses of a copyrighted program without placing the program in the public domain, and, in general, that is what should be done.

If you abandon the right to control copying, not only are you permitting the public at large to make copies for their own use, but also you are permitting anyone to copy and then sell your program. Do you really want a giant company to package your program in a slip binder, put their name and logo on it, and sell it for \$595? While paying \$595 for a program that is available elsewhere for free might seem irrational, good marketing can be very persuasive; a company that acquires a program for free and sells it for \$595 can afford to spend much more for advertising than the original author.

A copyright protects not only the author's right to copy the work, but other important rights as well, including

the right to produce derivative works. This is a particularly valuable right if you are giving away an early version of a program that you hope eventually to polish into a traditional commercial product. By retaining the copyright, you can prevent competitive marketing of works that incorporate your core program; by placing your program in the public domain, you cannot.

The first suggestion, then, is to retain the copyright on the program and place in the public domain only those rights that are consistent with the reason you have chosen to allow free distribution: if you are doing it for fame, require that your name appear on the introductory screen of any program based on yours (if you expect donations, you will want to be sure that your name and address appear anyway); if you are doing it for the benefit of those people who cannot afford to pay \$595, retain the sole right to sell the program (or place a limit on the price that can be charged); and, if you are doing it as a beta test of a program under development, retain the sole right to produce derivative works.

You can accomplish these objectives by placing a copyright notice on the work and then licensing the right to

use the copyrighted work. Ordinarily, a copyright notice is placed on the diskette and any accompanying manuals. Because user-supported software is distributed in chain-letter fashion, it is impossible to label the distributed medium. However, the software can be labeled by displaying a copyright notice on the user's screen. The notice should be in the form "Copyright (c) 1986 Author's name. All rights reserved."

The more difficult copyright question is whether to register the work or not. Registration is conceptually simple, but it may raise difficult questions. If your program contains no trade secrets, registration is accomplished by mailing a copy of your program (with the appropriate form or forms) to the U.S. Copyright Office, along with the registration fees. Textual works are registered using *Application Form TX, Kit No. 113* (which is available by mail from the U.S. Copyright Office, Library of Congress, Washington, DC 20559, or by telephone from the 24-hour Forms Request Hotline, 202/287-9100).

Registration establishes beyond question the existence and contents of the program as of the registration date. Registration, however, creates a public record of your program. Therefore, if

your work contains trade secrets, several options must be considered. The first is to forego registration. The second is to register the source code, but to delete the secret portions, sacrificing protection for the omitted portion. A third option is to register compiled code on the theory that few people can reconstruct your proprietary techniques from compiled code. The U.S. Copyright Office will accept such a filing, but will not guarantee that a valid copyright has been secured.

Registering incomplete code will generally be the preferred option and can be done in one of two ways. The traditional way is to request a special exception to the filing requirements, permitting the deposit of source code with selected lines of code blacked out. Current copyright office policy is to grant permission to file only the first and last 25 pages of source code with up to 50 percent of the lines deleted. An alternative approach is available, however. The code can be registered with whatever deletions you choose and with comments indicating where code has been omitted and, in general, what the omitted code did. This will protect the (presumably nonfunctioning) code—unlike patents, copyrights do not need to be capable of functioning. The complete program then would be protected to the extent that it constituted a derivative work of the incomplete code.

Patent protection has recently become a subject of renewed interest with respect to computer programs. Patent rights are lost if an application is not filed within one year from the first date the program is offered commercially. If there is a possibility that you may want to apply for a patent on your program at a later date, you need specific legal advice before you begin even user-supported software distribution.

Protecting your proprietary rights in the software is only half the story; personal liability is the other half. The mere fact that you are not "selling" your program commercially does not of itself insulate you from liability.

One factor in determining potential liability is whether or not the Uniform Commercial Code (UCC) applies to user-supported software transactions. The UCC is a core of statutory provisions that forms the basis of the commercial law in most states. Among its provisions are the creation of certain implied warranties, such as those of merchantability and fitness for purpose. Shrink-wrapped licenses disclaim such warranties, because, in the absence of

## Personal REXX for the IBM PC

- ★ Interpreter for the full REXX language, including all of the standard REXX instructions, operators, and built-in functions
- ★ Sophisticated string manipulation capabilities
- ★ Unlimited precision arithmetic
- ★ Direct execution of DOS commands from REXX programs
- ★ Built-in functions for DOS file I/O, directory access, screen and keyboard communication, and many other PC services
- ★ Compatible with VM/CMS version of REXX
- ★ Uses include:
  - Command programming language for DOS
  - Macro language for the KEDIT text editor
  - Can be interfaced by application developers with other DOS applications, written in almost any language

an effective disclaimer, the UCC gives buyers remedies if the goods they purchase do not conform either to the customary definition of what they purport to be or to the specific needs of the customer (that is, if the seller is aware of those needs and his expertise has been relied upon to choose appropriate goods). User-supported software distribution arguably is not within that particular scope because the acquiring party has no obligation to make any payment to the author of the program.

I am not aware of any judicial determination of whether user-supported software is covered by the UCC and it is unlikely that you will want to be the defendant in the first case to consider the question. Therefore, you can limit your exposure in the same manner that traditional sellers of software do: with a license agreement. The concept of licensed user-supported software may seem inconsistent at first. Let me sketch out a method of licensing user-supported software that seems to be compatible with the notions of user-supported software distribution.

To begin with, the user-supported software is copyrighted for the reasons described above. The first screen of any independently accessible module of the software (including README files, disk-based manuals, and, of course, the program itself) displays the copyright notice and a statement that the program is licensed, at no charge, subject to the following conditions:

1. The program may be copied ad lib provided that the author's copyright notice and disclaimers of warranty are reproduced in full.
2. Copies of the program may not be sold for more than \$10 each.
3. The program is supplied as-is and the author disclaims all warranties, expressed or implied, including, without limitation, the warranties of merchantability and the warranties of fitness for any purpose.
4. The author's name and address, a mechanism for registration, a statement of an appropriate payment (if desired), and (if appropriate) an offer of updates upon receipt of registration should be included.

The registration procedure should consist of sending the author a statement such as "Please register me as an owner of a copy of your XYZ user-supported software program. I agree to your disclaimer of all warranties and your restrictions on copying." Having a signed statement eliminates the concern that shrink-wrapped licenses might not

be enforceable. If you receive a check but no acknowledgment, you probably have an enforceable agreement. Keep a copy of the check as evidence.

One final issue needs to be addressed. User-supported software notices typically request "contributions." If you distribute user-supported software and receive contributions, you are receiving income and your contributor is making a purchase for federal tax purposes. Unless you are a registered tax-exempt organization, do not suggest

that contributions are tax deductible (unless, of course, they legitimately qualify as business expenses).

If you decide to place your software in the public domain for the good of mankind, blessings on you. Just remember that even good works have eventual consequences.

# Overland Data's Answer to Backup

FLASHBAK™ makes backup so fast and convenient, users find that they actually *do* back up their files as regularly as they know they should.

## **A new high-speed, 9 track tape backup and file management program.**

FLASHBAK has a window-oriented user interface, offers a tree display of the DOS hard disk file system, and provides context-sensitive help menus. It has file-oriented backup and retrieval, and various selection and deselection criteria for backup and restore, including archive bit, and time and date stamp.

FLASHBAK supports multi-volume tapes or floppy disks, and provides file system management commands such as copy and delete functions.

## **FLASHBAK backs up MS-DOS files to 9 track tape.**

Overland Data includes FLASHBAK with Tape Linx, a 9 track tape subsystem for the IBM PC, XT, AT and compatibles.

## **FLASHBAK backs up MS-DOS files to floppy disk.**

Overland Data offers stand-alone FLASHBAK, a complete floppy-based backup system for personal computers.

Call today for your answers on backup.

# A Classic Revised

*Wirth's remake of his Algorithms + Data Structures = Programs offers basically the same text as the original, with examples in Modula-2 rather than Pascal.*

## **Algorithms and Data Structures**

Niklaus Wirth (Prentice-Hall; Englewood Cliffs, New Jersey; 1986) 288 pages, hardcover, \$34.95

Niklaus Wirth, the man who invented the Pascal and Modula-2 programming languages, has revised his classic *Algorithms + Data Structures = Programs* (1976). The new edition, entitled

*Algorithms and Data Structures*, gives examples in Modula-2 rather than Pascal. Apart from this, most of the original text has been left unchanged.

Unfortunately, this new edition is poorly typeset. As a result, although the new edition still deserves to be called a classic, readers who do not particularly need the new Modula-2 examples may prefer to continue using Wirth's earlier version of the book.

The purpose of the book is to explain why Wirth designed Pascal and Modula-2 the way he did. His goal was to make these languages simple, but expressive, on the principle that a few simple features, carefully chosen, can be put together to build powerful programming tools. Therefore, in *Algorithms and Data Structures*, Wirth concentrates on how programmers can use the features of Modula-2 to implement their own ideas.

The book's greatest strength is that it bridges the gap between formalized mathematical treatments of algorithms and practical, how-to books about programming. In this book, the programming language is the formalism—Wirth achieves a high level of abstraction while writing all his examples in a real programming language.

The book begins with fundamental data structures. Most programming languages do not really have a *concept* of

type, only an *inventory* of types, such as real, integer, character, and Boolean. Wirth's main insight is that a type is a range of possible values. Thus, it makes sense to define not only "integer" but also "positive integer," or even "integer between 10 and 20," as data types in a language. Pascal and Modula-2 allow users to do just that. Subranges, records, and arrays are discussed exactly as in Wirth's earlier book.

The section on files in the new edition has been completely rewritten. In Pascal, a file is an object from which characters are extracted, and the functions `eof` and `eoln` look into the future to warn of an approaching end-of-line or end-of-file mark. (These functions were impossible to implement for keyboard input, because the system cannot predict whether the user is about to press Enter, creating an end-of-line mark.) In Modula-2 this need for looking ahead has been removed; an end-of-file mark is detected by actually trying to read past it. A file is mapped onto a data structure called a *sequence*, which is, basically, a potentially infinite array.

The first chapter ends with a new section on searching, including the standard linear and binary search techniques and the recently discovered Knuth-Morris-Pratt and Boyer-Moore string search algorithms.

Sorting is covered next. Wirth points out that simple sorting methods, although inefficient, are easy to remember and to code. After analyzing the performance of such methods, he observes that "Bubblesort has hardly anything to recommend it except its catchy name." According to Wirth, the most useful of the simple sorting algorithms is the straight selection method. More complex sorting methods, such as recursive algorithms and algorithms that depend on merging separate work files, also are covered in this chapter.

Wirth points out that in most textbook examples of recursion, the recur-

sion used in the example is not really needed to solve the problem, which may be why so many programmers view recursion with a vague uneasiness. Recursion is a tool of thought for programmers, not a feature of the computer hardware. It should be applied to problems that human beings naturally think of in recursive terms—that is, tasks embedded in other tasks of the same kind. Wirth shows how to transform simple recursive programs into nonrecursive form. In addition, he illustrates recursion with Hilbert curves and backtracking problems.

Chapter 4 begins with the observation that a linked list is a recursive data structure—it can be thought of as a record containing another record of the same type. From this starting place, Wirth moves on to explain pointers, list manipulation, binary trees, and B-trees (which are search trees that can conveniently be broken up into more than one record or file). To complete the discussion of search methods, a new section on priority search trees has been added at the end of this chapter.

The final chapter, which covers hashing, was originally part of chapter 4 in Wirth's first edition. The chapter on parsers and compilers that ended the first edition has been deleted in the revised edition, with a hint that Wirth may be working on an entire book on that particular subject.

The typography of the new edition is a big step down from the previous one. Wirth typeset the new edition himself on a laser printer, and the type is far too light (thin) for its size. On the whole, the book is hard to read. The spacing between lines is uneven and many typographical errors have been introduced. Do-it-yourself typesetting, however fashionable, is not yet sophisticated enough to be a truly satisfactory substitute for the traditional tools of the printing industry.

—MICHAEL A. COVINGTON

# SOFTWARE SENTINEL™

MUCH  
MORE THAN  
JUST PROTECTION

Stop unauthorized use of software...and keep your customers happy at the same time. The no-interference hardware keys from the industry's leading supplier put money in your pocket and save you from angry customer complaints. Our product line includes devices for either parallel or serial port. The latest addition allows you to **cover multiple programs with one device and/or customize as needed.** Call for new low prices.

## SOFTWARE DEVELOPER BENEFITS

- Prohibits unauthorized use of software
- No need for copy protection
- Algorithm technique (never a fixed response)
- Virtually unbreakable
- Higher level language interfaces included
- 100 times faster (1ms) than fixed response devices
- Minimal implementation effort
- Runs under DOS and Xenix, on IBM PC, AT, XT & compatibles

## SOFTWARE USER BENEFITS

- Unlimited backup copies
- No floppy required with hard disk
- Pocketsize
- Transparent
- Transportable

## SOFTWARE DEVELOPERS FAR EAST BUSINESS OPPORTUNITY

Kanematsu-Gosho, a prominent Japanese trading company, in conjunction with Tokai-Create, one of Japan's largest software marketing firms are soliciting submissions of business related applications software for consideration for export to the Japanese market.

The Japanese PC market is presently approximately 2.5 million units with an anticipated annual growth rate of 25% over the next five years. This offer presents a unique opportunity for U.S. software developers to enter this burgeoning market which has previously been difficult to break into.

Your Japanese partners will be taking care of all the translation, marketing and sales functions in this most interesting market. Successful development companies will be rewarded with a substantial revenue stream for the term of the contract with Japan.

Submitted products will be subjected to a series of evaluations. The initial U.S. based screening will be conducted by CSSL, Inc. The U.S. representative of the Japanese principals. Successful products will be forwarded to the U.S. offices of Kanematsu-Gosho for further testing and evaluation. Final evaluation will be completed by the parent companies in Tokyo.

**Please submit full working versions of your applications software no later than February 28, 1987 to:**

## Release the Power of Fortran, C and Pascal

A library of over 120 Assembler routines transforms FORTRAN, Pascal and C language compilers into a flexible, responsive language for the microcomputer environment. Existing mainframe code may be converted with ease, saving time and money. With the powerful Assembler sub-routines of **NO LIMIT™**, mainframe users can fully realize the advantages of microcomputer technology.

- Complete Communications
- File/Directory Management
- Full Screen/Keyboard Control
- Extensive Graphics Applications
- Character/String Manipulation
- System Information
- And much more!

**NO LIMIT™** is available for \$129, with no license fee, and supports MS/FORTRAN/Pascal/C, IBM Professional, Ryan-McFarland, and Lahey F77L compilers.

**M·E·F  
Environmental,  
Inc.**

## MEMORY RESIDENCY MADE EASY

CrackerJack Microsoftware Corporation is proud to introduce "**JACK™**", the Resident Program Developer's Kit. **JACK** contains everything you need to create your own RAM resident software without any of the headaches of memory management, windows, or DOS re-entrancy.

With **JACK** at your side, creating programs as good as **SIDEKICK™** couldn't be easier !!! Now you can concentrate on how your program should run, instead of worrying about how to make it memory resident.

### JACK FEATURES:

- Virtually any EXISTING C or ASSEMBLER program can be made memory resident with no need for modification to the code. [PASCAL will be supported in the near future.]
- Automatic screen save on popping up and restore upon popping down.
- Your choice of Hotkey and interrupt vector for program use.
- You can use DOS function calls in your memory resident program.
- All programs developed with **JACK** will coexist with each other peacefully. No more system crashes and lost data.
- **JACK** applications can be loaded in any order and popped-up in any order. Less support problems for you and no headaches for the end user.
- Your program will beep if it is not possible for you to pop up at the time desired.
- Since **JACK** does not make any use of undocumented DOS calls, programs developed with it will not become obsolete when Microsoft releases a new version of DOS. [**JACK** requires DOS Version 2.0 or higher].

Finally, a standard for easily creating memory resident programs has arrived !

To Order, send \$199.95 [US] by certified check or international money order to:

# NEED IT FAST? WANT TO KNOW MORE? DON'T HAVE TIME TO SHOP AROUND? INTRODUCING...

If you're like most system professionals you're up-to-date about the products in the PC marketplace. You're aware of brand and model differences, are informed about connectivity and compatibility problems, and you shop for competitive prices and fast service.

You're also probably among the many PC TECH JOURNAL readers who purchase by mail. That's why we're starting THE MART—PC TECH JOURNAL'S First Class Mail-Order Section.

Starting this month, and every month hereafter, you'll find the products you're looking for advertised in THE MART—and you'll benefit from the fast service and helpful support that identifies PC TECH JOURNAL advertisers.

If you're ready for First Class service, you're ready for THE MART.

### INTRODUCING

**4CaST/2™ Complete Forecasting System**

For marketing, planning, financial and forecasting professionals:

- Easy to use menus with on-screen help facilities
- Most often used forecasting methods
- Popular spreadsheet interfaces
- Outstanding color graphics
- Fast RAM-based program
- Thoroughly tested and numerically accurate
- Exponential smoothing
- Step-wise and robust capabilities
- Macro language for applications
- Full documentation

Only: \$350 Demo D

4CaST/2X: includes a f

version of the Census'X

Only: \$595 Demo D

Both versions run on IBM PC XT AT

## Turbo Screen/Application Generator

### Be 3-6 times more Productive!!!

### Guaranteed\* For \$69<sup>95</sup> (one month holiday special)

Turbo Master helps you develop your functional specs (Generates Screen, File, Isam, Variable and Menu Control Documentation) and then allows you to "Quickly" prototype a validation model of your system. (Which can be incorporated as part of your functional specifications.) Turbo Master can then generate a super-fast Turbo Pascal Program that features advanced screen input and control, a professional control menu, the database functions of (1) Add/Edit/Delete Records (2) Search Database by any Key (3) Database Recovery programs (4) Screen/Printer Report for each of the keys. Each Key can have up to 6 fields.

#### Our Users Report

- "Since Fall of 85, I have generated over 300 program modules with it and find it to be just what I needed. Most all of the modules represent 5000 to 8000 lines of Pascal Code" Oner Systems.
- "By being able to produce a 21 screen and menu control demo so quickly helped me obtain the contract."
- "Speeded up my screen development by 6 times" Elexor Associates.
- "Has many of the features of the Super Mini development tools costing \$10,000." Applied Micro Systems.
- "Saved months from having to recode portions of our system." Real Green Inc.
- "We developed 3 Vertical Market Applications in the 6 months we had your system." Absolute Systems.

#### \* RISK FREE TRIAL

I try the demo package included for 30 days.  
If not pleased return for a full refund.

#### Receive 6 Floppy Disks and a manual containing:

1. **Screen Painter/Editor & Generator** • Paint menu screens using keyboard • Has variable dictionary to provide consistent edits • Date entry masks • Date & range checks • Field and/or global help screens • Box & line drawing • Error & message handler
2. **Help Screen Maker** • Different help screen for each field.
3. **Menu Editor & Generator** • Allows selection by 4 methods.
4. **Database Program Generator** • Produces "Easy to Read" code that can be easily modified by experienced developers.
5. **Resident Isam Module** - compatible with Turbo Toolbox, but saves 8K of codespace and 10K of dataspace.
6. **Turbo Resident Screen Capture Utility** which allows you to capture Text Screens from any running program.

## TOSHIBA Lap-Top T-1100 Plus (DUAL FLOPPY)

**\$1695<sup>00</sup>**

- 256K Ram Memory
- CMOS 80C86 Running at 7.1 MHz • Two 720K 3.5" Floppy Drives
- One Expansion Slot • TOSHIBA Keyboard • LCD Display • Color Graphics/Monochrome Composite Card • One Parallel and Serial Port • Clock Calendar
- External Floppy Drives Optional.

- IBM AT Compatible
- 512K of RAM expandable to 1MB
- 1.2MB Floppy
- AT Keyboard
- Documentation and Diagnostics
- Made in the USA

**\$1349<sup>00</sup>**

From B C Associates — SimpleNET™

## SIMPLY THE LOWEST COST LAN

Yes, it's true, now you can take control of your data handling problems and implement your own PC local area network for only **\$99.00** per station (plus software, power supply and cables).

Are you tired of carrying around a box of diskettes just to transfer information among your many PC systems in your office? You've probably looked into networks, but the high cost of such systems kept you away.

Now there's SimpleNET™. A truly low cost/medium performance alternate to the high priced systems. SimpleNET uses a small interface module which attaches to your PC systems and a PC Network (DOS 3.x) compatible network BIOS program. The interface allows up to 32 users to be connected via a single interface cable with a maximum cable length of 1,2 kilometers (how about 4000 feet?). The software interface is compatible with DOS 3.x and the new PC Local Area Network Program available from your IBM dealer.

### SimpleNET Basic System\* — For up to 4 users

- Interface/Power supply module. (One power supply module is capable of driving 8 stations.)
  - User Interface modules
  - Network BIOS Software
  - Cable Package
  - Installation/Operations Manual

**Only \$695<sup>00</sup> Complete**

Additional user can be added for \$99.00 each.

\*Requires IBM PC/XT/AT or compatible with one available asynchronous communications port.

**PROGRAMMERS AND SOFTWARE DEVELOPERS - LOOK AT THESE PRODUCTS!  
NO ROYALTIES REQUIRED**

#### ASMLIB

##### The Programmer's Library

- A Multipurpose set of over 200 Assembly Language sub routines supplied in the form of a linkable library.
- Virtual disk file handling.
- Int. driven asynch. support.
- Graphics on EGA, herc. and CGA.
- Floating point math and trig routines with 8087 support.
- Installable keyboard activated programs are easily written with ASMLIB's special functions.
- Plus much, much more.
- Supplied with complete source code.

**Only \$149<sup>00</sup> Complete**

#### asmTREE

##### The Programmer's B+Tree Data File Management System

- A complete single/ multiuser database management system written entirely in Assembly Language gives the Lattice "C" or Assembly Language programmer these capabilities.
- Up to 256 users.
- Up to 256 index and data files.
- Multiple key types.
- Multiple indices per index file.
- Duplicate and variable length keys.
- Virtual file handling
- Plus much, much more
- Supplied with complete source code.

**Only \$395<sup>00</sup> Complete**

**GenericGL** - Generic general ledger package can be used by any program...UDS...\$295.00

**FSEdit** - Full screen edit package by UDS...\$49.95

#### REALIA COBOL USERS!

**FPLIB** - Floating point library package with 8087 support and trig functions...\$149.00

**Full Money Back Guarantee**

### PC ANALYZER

Real-Time debugging package for your PC or XT. Complete with board and debugging software. Also allows you to use your own software debugger. Nonintrusive operation, simple to install. Operates with DOS & QNX. Price \$995. Free shipping.  
Sofpak Technologies, Inc.  
215 Stafford Road, Unit 101  
Ottawa, Canada K2H 9C1  
(613) 726-1908

### DIGITAL SIGNAL PROCESSOR

The Model 10 coprocessor board is based on the 16/32 bit T1 TMS 32010 and is designed for applications in communications, speech, instrumentation, and numeric processing. A 1K complex FFT takes 90ms. Offered with onboard 12 bit 40 KHz A/D and D/A. Includes all utility and applications software. \$650-\$850.

Dalanco Spry  
Suite 241 2900 Connecticut Ave. NW  
Washington, DC 20008  
(202) 232-7999

## HARDWARE COMMUNICATIONS

### VIDEO LAN 'LINK SYSTEM'®

FOR IBM, PC, PC/XT, PC/AT labs. Instructor has complete control of all trainee computer monitors. Instructor can 1) transmit image, 2) receive trainee image or 3) transmit any trainee image to any/all trainees. Color or mono. Software independent. Increases instructor efficiency and trainee comprehension.  
APPLIED COMPUTER SYSTEMS, INC.  
3060 Johnstown-Utica Road  
Johnstown, OH 43031

Calgary, Alberta, Canada T2A 5V5  
(403) 248-1250

### DATA ACQUISITION & ANALYSIS

\*MEASURE for data acquisition directly to Lotus 1-2-3\*FOURIER PROSPECTIVE II advanced signal digital analysis \*Lotus Manuscript & technical document preparation system\*PRIME FACTOR FFT subroutine library. Call Turbo Pascal, C, Fortran, Basic. Up to 65,520 data-points. 2D available\*Turbo Pascal from Borland \*TELEVISION for Image Communications \*8087 Coprocessors, all varieties\*Dash-16A/D converter board from MetraByte. ALLIGATOR TECHNOLOGIES, INC. P.O. Box 11386  
Costa Mesa, CA 92627 (714) 662-0660

## SOFTWARE/SECURITY

### "NEW" BIT-LOCK® SECURITY

Piracy SURVIVAL ">4" YEARS proves effectiveness of powerful multilayered security. Uses rapid decryption algorithms and small reliable port for transparent security device. NOW AVAILABLE for PARALLEL or SERIAL port. NEW KEY-LOCK™ security device available at HALF-PRICE. MICROCOMPUTER APPLICATIONS  
7805 S. Windermere Circle  
Littleton, CO 80120  
(303) 798-7683 or 922-6410

### SECURE AT/XT/PC

Control system access, data access! FIXT/S. Control system boot for most popular XT/PC hard disk controllers. Feature for AT-and-XT-compatible HD controllers segments hard disk by volumes, controls access with passwords, supports hard disk expansion. \$80-\$120 + \$3 shipg. plus CA tax.

Golden Bow Systems  
2870 Fifth Ave. Suite 201  
San Diego, CA 92103  
(619) 298-9349

## SMART COPY PROTECTION

Attention Software Developers, are you tired of Copy Protection that:

- is NOT transparent to the user.
  - does not allow backups.
  - requires I/O plugs or special media.
  - doesn't support hard or cartridge disks.
  - makes you pay for every disk protected.
  - requires source code changes.
  - can be beaten by hardware copy boards.
- If so, EVERLOCK can solve these problems for only \$495. Free info & demo disk available.

Az-Tech Software, Inc.  
426 Grandview  
Richmond, MO 64085  
(816) 776-8153

## SOFTWARE/SERVICES

### TAPE/DISK CONVERSIONS

Conversion services to or from over 500 computer systems:

- Magtapes
- Micro Computers
- Mini Computers
- Word Processors
- Typesetters

Our conversion capabilities surpass most in the industry.

Pivar Computing Services, Inc.  
165 Arlington Hgts. Rd. #T  
Buffalo Grove, IL 60089  
(312) 459-6010

### DOCUMENTATION-BY MAIL™

Technical writing service specializing in long-distance production of economical and timely manuals for small, medium-sized and large developers. Tutorials, user's guides, reference manuals. Fixed price contract, professional quality, quick turnaround. Call for credentials, sample and free estimate.  
BNP Enterprises, Inc.

# TECH BOOK

## SOFTWARE/STATISTICS

### STATISTICS FORECASTING

TWG/ARIMA—a univariate Box-Jenkins forecasting package, designed for statisticians.

EASI/ARIMA—same as above, for the non-statistician.

ELF—The Statistical Package—a general purpose statistical package. Call or write for more information. **\$150. EACH.**

THE WINCHENDON GROUP, INC.

P.O. Box 10339  
Alexandria, VA 22310  
(703) 960-2587

### STATISTIX™—ONLY \$75!

STATISTIX is a powerful and very easy-to-use interactive statistical system for micros. Used by many major universities, businesses, state governments and research organizations. Please check us out before you buy a statistics program; you'll agree SX is a "best buy"! SATISFACTION GUARANTEED—For more info:

NH ANALYTICAL SOFTWARE

801 West Iowa Avenue  
St. Paul, MN 55117  
(612) 488-4436

### RATS! VERSION 2.0

RATS, the best selling Econometric software package now includes daily & weekly data, a new, easier to use 500-page manual, & many advanced features. Use RATS for time-series & cross-section regression, including OLS, ARIMA, VAR, logit, & probit. IBM PC or compatible. \$200. VC/Visa. Call for brochure.

VAR Econometrics, Inc.

P.O. Box 1818  
Evanston, IL 60204-1818  
(1800) 822-8038

### P-STAT®

Full mainframe package for IBM PC/XT/AT & compatibles. Combines data & file management, data display, statistical analysis, report writing & survey analysis in a single package. 4GL programming language, online HELP, menu or command driven with interactive EDITOR. \$95 demo and Site License available.

P-STAT, Inc.

471 Wall Street, P.O. Box AH  
Princeton, N.J. 08542  
Telephone: 609-924-9100  
Telex: 466452

### STATISTICAL FORECASTING

AUTOBOX, AFSEZF, AUTOBJ, BOXX, MTS and SIMBOXJ—a complete line of programs for Box-Jenkins time series analysis and forecasting. Combine the ultimate in sophisticated forecasting procedures with unparalleled ease of use. Call or write for more information—find out why our users are our best reference!

AUTOMATIC FORECASTING SYSTEMS, INC.

P.O. Box 563 Dept. T  
Hatboro, PA 19040  
(215) 675-0652

### The One You Can Rely On

BMDP offers the most complete collection of programs for data analysis, backed by comprehensive documentation & competent technical support. BMDP was the 1st stat package ever developed and the BMDP programs have been trusted by statisticians more than 20 years. Hard disk req'd. Call for brochure.

## SOFTWARE/TAXES

### Where Does the Time Go?

TUSKER knows! TIME & USAGE KEEPER logs and reports your computer time; meets and exceeds IRS requirements for proving tax deduction.

\*Define your own business uses

\*6 reports in any date range for any printer

\*Log non-computer time too!

DOS 2.0+. \$88. Free brochure. \$4 demo disk.

Craig Banning

Route 3, Box 317  
Big Pine Key, FL 33043  
(305) 872-3817

## SOFTWARE/TERMINAL EMULATION

### BARR/HASP INTELLIGENT RJE WORKSTATION

Hardware and software communications package for IBM PC, XT and AT. Simultaneously transmits data to host and receives output directly to MVS/JES2, MVS/JES3, VS/RSCS, and CDC/NOS, bypassing TSO and CMS. Emulates IBM 3777-2 and HASP on IBM 360/20. Line speed: 1,200 to 19,200 baud (56,000 bps on AT). Supports multiple high-speed printers beyond 2,400 lpm. (6,000 lpm on AT). Features: concurrent DOS, LAN support, printer forms control, plotter support, unattended operation, easy installation. \$890 includes Hardware & Software.

BARR SYSTEMS, INC.

2830 NW 41st Street, Building M  
Gainesville, FL 32606  
(800)-BARR-SYS/(904) 371-3050

## SOFTWARE/UTILITIES

### AT/XT/PC HARD DISK EXPANSION

\*Replace hard disk with a bigger one, or add a second drive! Vfeature BREAKS THE 33 MBYTE BARRIER on standard AT, XT, and compatible hard disk controllers. Includes multiple volumes, security features, selectable clusters, keyboard lock. \$80-\$120 + \$3 shipping + CA Tax\*

Golden Bow Systems  
2870 Fifth Avenue, Suite 201  
San Diego, CA 92103  
(619) 298-9349

### TallScreen—DOS POWER

Natural extension of DOS. Scroll back through screen output, edit text on full screen, mark blocks to printer or file, recall commands & directories, enter multiple commands, capture screens from application programs, create user profiles. Solid tech support. PC MAG & PC WORLD calls TallScreens a Real bargain at \$49.95. VISA/MC

Qualitas, Inc.

8314 Thoreau Drive  
Bethesda, MD 20817  
(301) 469-8848

### SAVE THAT SCREEN!

Do you immediately reach for the PrtSc key to save screen info? What a waste of time and paper! Now, SCREENSNAP™ lets you save and recall up to 9 screens at the touch of a key. Friendly with other resident programs but unlike some it is compact; will run in as little as 5K. Also includes useful utilities to save and recall from files, programmer's interface and sample code. Build your own help screens with your text editor, then save and recall them with SCREENSNAP. \$39.

# REQUIRED READING FOR ALL IBM PC SYSTEMS EXPERTS

If you're a systems expert, microcomputer specialist, or MIS/DP professional working with IBM PCs, you need the comprehensive information PC TECH JOURNAL provides 13 times a year!

It's the only magazine that provides you with the technical information to help you increase the performance of your multi-component system. It talks to systems experts and systems designers in the language you understand—about the applications and products you have to know about!

As part of your annual subscription to PC TECH JOURNAL, you'll receive the special PC TECH JOURNAL Directory issue published in November, the most comprehensive guide and index to the products in the PC marketplace and PC TECH JOURNAL's coverage!

Don't leave a gap in your required reading, subscribe to PC TECH JOURNAL now and save 50%!

**For faster service call Toll-Free 1-800-852-5200 today!**

Send me PC TECH JOURNAL for:

- ☐ One year (13 issues) for \$26.70. **SAVE 50%!**  
☐ Two years for \$53.35.

Savings based on annual single-copy price of \$53.35.

# ACCESS<sup>TM</sup> 386

**First Again,  
The Future  
Of Virtual  
Machines  
Is Here Today!**

80386 includes  
Special Edition  
Virtual Mode

**DESQ<sup>TM</sup>  
view**

**Advanced Logic Research, Inc.**, the first computer company to introduce the 80386 system. **Advanced Logic Research** again is the first company to include a special edition of **DESQVIEW<sup>®</sup>** software to take advantage of the 80386 virtual mode.

#### Access 386 Multitasking Windows

This **DESQVIEW** software can control nine (9) simultaneous **MS-DOS<sup>®</sup>** applications running concurrently, plus **QEMM**, a **Lotus<sup>®</sup> / Intel<sup>®</sup> / Microsoft<sup>®</sup> (LIM)** expanded memory specification compatible. The **QEMM** breaks the 640K memory barrier to 8 megabytes of high speed memory. This creates bigger spread sheets, sorts larger databases and powers through your most complex programs at pulse quickening speed!

**ACCESS 386** more than triples your processing capacities. A 32 bit interleave memory data path eliminates through put slowdowns by doubling the flow capacities of 80286 16 bit systems.

This memory through put, plus the speed of a 16 MHz 80386 CPU will streak through industry standard software faster than anything else!

#### ACCESS 386

**Advanced Logic Research** offers a complete family of 8088, 80286 and the NEW 80386 based microcomputers in a variety of configurations. Please contact your nearest authorized **ALR** dealer for brochures on the enhanced IBM compatible microcomputer manufactured by **Advanced Logic Research**.

#### PERFORMANCE

##### MODEL — ACCESS 386-40

- 80386-16 32 bit processor
- 16MHz CPU Speed
- Phoenix BIOS
- 1Mb RAM Expandable to 10.5 megabyte
- 1.2MB floppy
- 42 Mb/28 MS hard disk drive
- Serial port, parallel port
- 80287-10 or 80387 support
- 8 system expansion slots
- **QEMM** - Expanded Memory (LIM) software
- **DESQVIEW<sup>TM</sup>** - Special Edition

##### MODEL — ACCESS 386-80

As above with 80 Mb/28 MS hard disk drive in place of 42 Mb/28 MS drive.

**Novell<sup>®</sup>

# The Launch Of Our New Flagship:

**Customizable, Expandable, and Responsive CROSSTALK® Mk. 4.**

It takes a powerful, flexible PC communications program to cut through the sea of incompatible systems you face today.

CROSSTALK® Mk. 4 has what it takes. More protocols — X.PC, Xmodem, Kermit, and our own CROSSTALK. More terminal emulations, including complete IBM 3101, DEC VT-100, and TeleVideo 900 series. Concurrent communications capability — up to 15 sessions. Error checking at high speeds. Beginners can use the simple menus, a clear help system, and prepared script files that help extract data from many popular information utilities. Experts can use the powerful command programming language to create extensive, customized "scripts." A unique modular architecture means we can quickly add new capabilities by phone. So

CROSSTALK Mk. 4 may be the launch of more than just today's standard in PC communications. It's probably tomorrow's as well.
